Biological Resources Assessment for the ±17-ACRE BEAVER CREEK STUDY AREA

INTRODUCTION

Project Location

Salix Consulting, Inc. (Salix) has prepared an updated Biological Resources Assessment for the ±17-acre Beaver Creek Study Area (study area) located in the community of Granite Bay, Placer County, California. The study area is located on the south side of Douglas Boulevard, just east of Sierra College Boulevard and Woodgrove Way. It is situated in Section 9, Township 10 North and Range 7 East on the Folsom, California 7.5-minute USGS topographic quadrangle (Figure 1). The approximate latitude and longitude for the center of the property are: 38° 44' 31" N and 121° 13' 00" W.

Project Setting

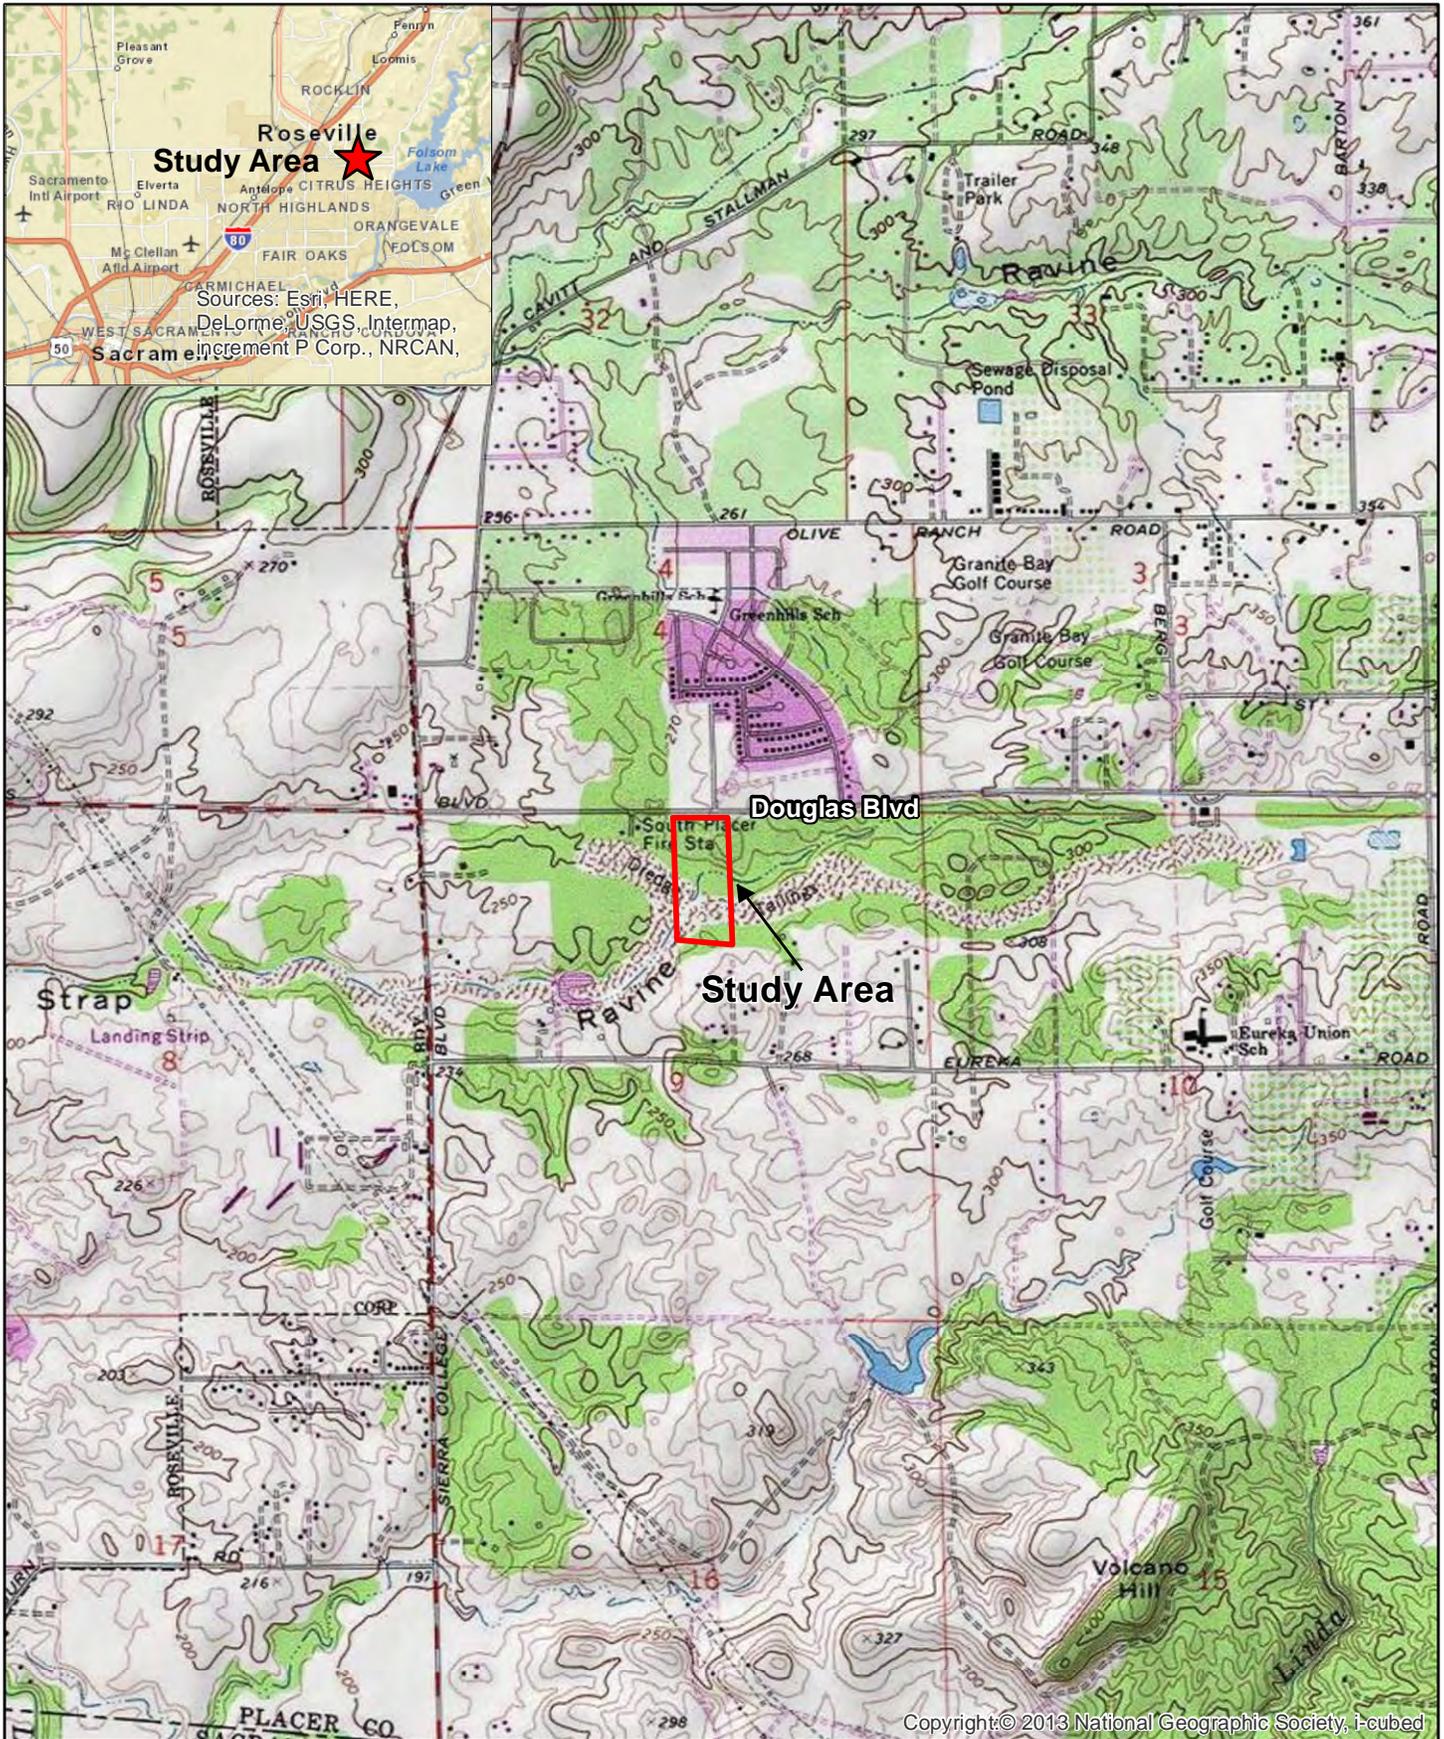

The site occurs at the lower edge of the western foothills of the Sierra Nevada at approximately 270 feet. The study area supports mostly foothill woodland and topography is highly variable due to the presence of historic dredge tailings throughout the site. Strap Ravine, a regionally intermittent stream, bisects the property and flows in a west and southwesterly direction. The study area is surrounded by newer residential subdivisions, rural residential properties, and undeveloped properties (Figure 2).

Project Background

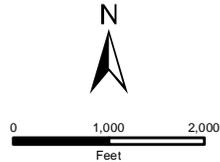

In 2004 North Fork Associates conducted a wetland delineation and prepared a Biological Resources Assessment (BRA) for this site, the ±17-acre Douglas Events Center Project Site, Granite Bay, California (NFA 2004a and 2004b). Salix recently conducted an additional field assessment. This report updates the 2004 BRA and provides current information on biological resources of the study area. Information from previous reports has been incorporated into this BRA where appropriate.

Objectives of Biological Resources Assessment

- Identify and describe the biological communities present in the study area
- Record plant and animal species observed in the study area
- Evaluate and identify sensitive resources and special-status plant and animal species that could be affected by project activities
- Provide conclusions and recommendations.

Granite Bay, Placer County, CA

METHODS

Literature Review

As part of this assessment, Salix biologists reviewed aerial photographs, USGS maps, and site maps for the study area. Standard publications were reviewed to provide information on life history, habitat requirements, and distribution of regionally occurring animal species. They include published books, peer-reviewed articles, field guides, and the California Wildlife Habitats Relationships Program. Chapter 5 of the Granite Bay Community Plan (Placer County 2012) and the Placer County Natural Resources Report (Placer County 2004) were also reviewed as part of this assessment for additional information on natural resources of the study area and surrounding region. Publications utilized in this assessment are included in the References section of this document.

The Wetland Delineation (NFA 2004a) and Biological Resources Assessment (NFA 2004b) previously prepared for the property were reviewed and information was incorporated into this BRA where appropriate. More recent studies on the known ranges and preferred habitats of special-status species known from the region were reviewed and the potential for occurrence of identified species within the study area was updated based on this information.

Special-Status Species Reports

To determine which special-status species could occur within or near the study area Salix biologists queried the California Natural Diversity Data Base (CDFW 2014) and the California Native Plant Society Inventory (CNPS 2014) for reported occurrences of special-status fish, wildlife, and plant species in the region surrounding the study area. The nine-quadrangle search area included the Folsom, Roseville, Rocklin, Pilot Hill, Citrus Heights, Clarksville, Carmichael, Buffalo Creek, and Folsom Southeast USGS quadrangles. Salix biologists also reviewed the following special-status species lists for the project vicinity:

- U.S. Fish and Wildlife Service (USFWS) list of Federal Endangered and Threatened Species for the Folsom USGS quadrangle;
- USFWS list of Federal Endangered and Threatened Species for Placer County; and
- California Department of Fish and Wildlife list of Species of Special Concern.

For the purposes of this report, special-status species are those that fall into one or more of the following categories:

- Listed as endangered or threatened under the federal Endangered Species Act (or candidate species, or formally proposed for listing);
- Listed as endangered or threatened under the California Endangered Species Act (or proposed for listing);

- Designated as rare, protected, or fully protected pursuant to California Fish and Game Code;
- Designated a Species of Special Concern by the California Department of Fish and Wildlife, or
- Designated as Ranks 1 or 2 on lists maintained by the California Native Plant Society.

Field Assessments

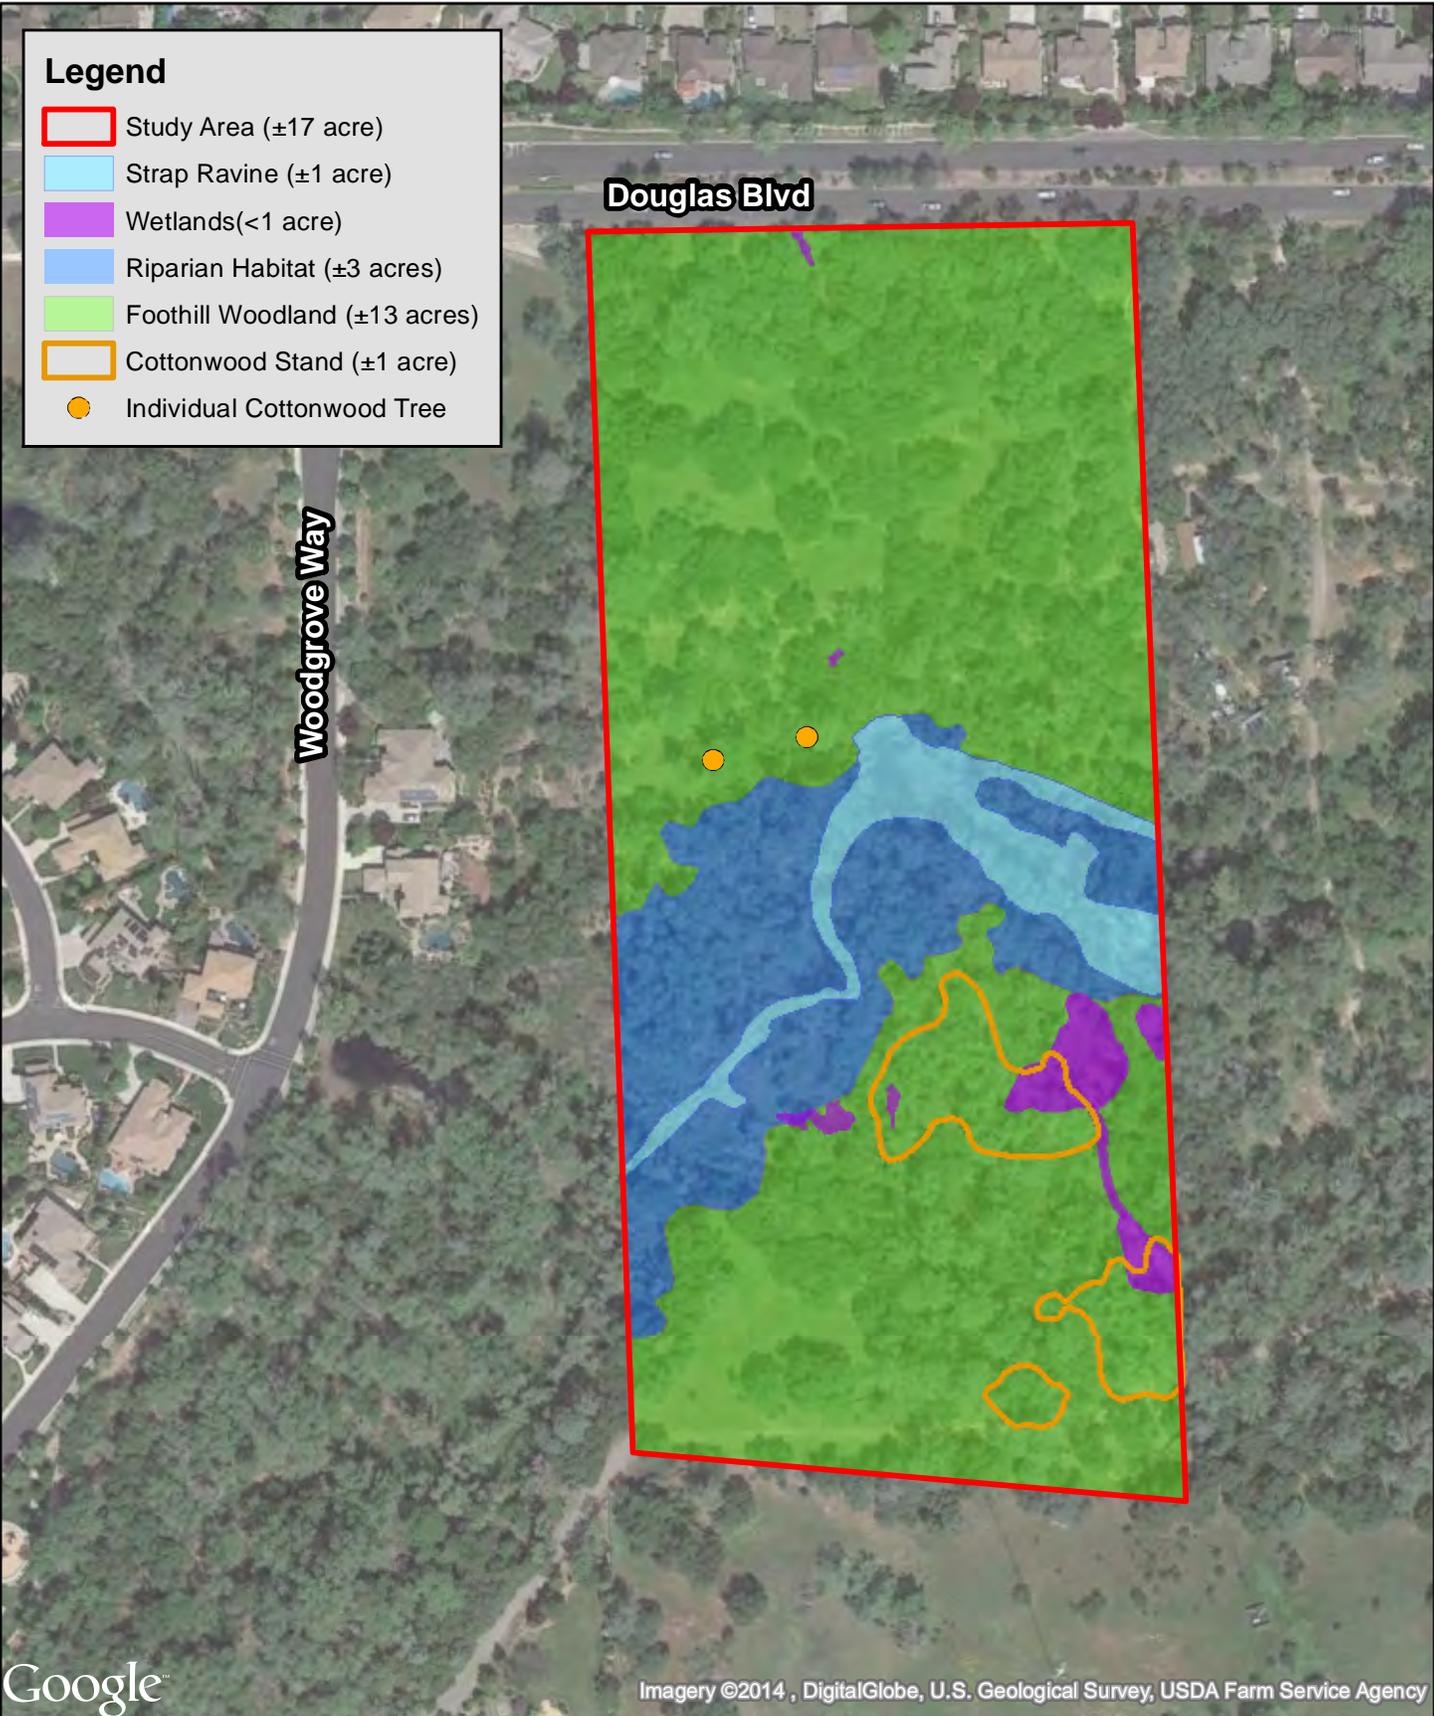

The field assessment of the study area was conducted by Jeff Glazner (plants and wetlands) and Gaylene Tupen (wildlife) on August 20, 2014, to provide information on sensitive plant and wildlife resources present on site. During the field assessment, plants and animals observed on site were listed, habitat types were determined, and the potential for the site to support special-status species known from the region was assessed. Biological communities and sensitive habitats of the study area were mapped and are shown in Figure 3. Representative site photographs are presented in Figure 4. Appendix A is a list of plants observed, and Appendix B is a list of wildlife observed onsite. Plant names are according to *The Jepson Manual: Vascular Plants of California, Second Edition* (Baldwin et. al. 2012). Standard manuals were used to identify wildlife species observed.

SURVEY AND LITERATURE SEARCH RESULTS

Biological Communities

Areas designated as “waters of the U.S.” throughout the Study Area, including streams and wetlands, are discussed below under **Waters of the U.S.** Appendix A lists the plant species that were observed during the field assessment. Biological communities and sensitive habitats of the study area were also mapped and are shown in Figure 3. Representative site photographs are presented in Figure 4.

HABITAT MAP

Beaver Creek

Granite Bay, Placer County, CA

Foothill Woodland in northwestern portion of study area.

Strap Ravine corridor in western portion of study area.

Seasonal wetland in southeastern portion of study area.

Foothill Woodland

Foothill woodland is the primary habitat type within the Beaver Creek study area, occupying approximately 13 acres of the site. Tree cover is variable throughout the site, and tree density is highest in the central and southeastern portions of the property, generally in areas near Strap Ravine. The dominant trees within foothill woodland include interior live oak (*Quercus wislizeni*) and blue oak (*Quercus douglasii*). Valley oak (*Quercus lobata*) occur in a few locations. Gray pine (*Pinus sabiniana*) also occurs as part of the woodland overstory throughout the site, mostly in the northern portion.

The shrub layer includes poison oak (*Toxicodendron diversilobum*), coyote brush (*Baccharis pilularis*), toyon (*Heteromeles arbutifolia*), buckbrush (*Ceanothus cuneatus*), Himalayan blackberry (*Rubus armeniacus*), oak saplings, and an occasional olive tree (*Olea europaea*). Common herbaceous species within the understory include field hedge parsley (*Torillia arvensis*), Italian thistle (*Carduus pycnocephalus*), yellow star thistle (*Centaurea solstitialis*), Italian rye grass (*Festuca perennis*), hedgehog dogtail (*Cynosurus echinatus*), soap plant (*Chlorogalum pomderidianum*), vetch (*Vicia* spp.), wild oat (*Avena fatua*), and riggut grass (*Bromus diandrus*).

Approximately one acre of mature Fremont cottonwood (*Populus fremontii*) stands are included in the foothill woodland habitat in the southeastern portion of the study area and are associated with historic placer mining.

Riparian Woodland

Within the study area, approximately three acres of riparian woodland occurs in association with Strap Ravine and consists of a mixed overstory of mature Fremont cottonwoods, Gooding's willow (*Salix gooddingii*), red willow (*Salix laevigata*), and some oak trees. This habitat type occurs in the central portion of the site and covers approximately 3 acres. Some areas along Strap Ravine have been heavily influenced by historic placer-mining and the understory is highly variable. Himalayan blackberry is a common understory species and occurs in dense thickets in many locations. In some reaches adjacent to the channel, wide fringe wetlands support herbaceous marsh species including cocklebur (*Xanthium strumarium*), willow weed (*Persicaria lapathifolia*), water plantain (*Alisma triviale*), broad-leaved cattail (*Typha latifolia*), and black sand spikerush (*Eleocharis pachycarpa*). Moisture persists in the fringe wetlands well into the dry season.

Strap Ravine and the seasonal wetlands area described below in the waters of the U.S. section.

Waters of the U.S

Wetlands on this property were mapped by us in 2004. The original wetland delineation identified four categories of waters of the United States and include: seasonal wetland, wetland swale, seasonal pond, and the Strap Ravine Complex totaling ±1.48-acres.

Within the study area, waters of the U.S. are embedded in the foothill woodland, riparian woodland, and cottonwood stands that are shown in Figure 3.

The Strap Ravine complex is a mosaic of fringe wetland and active stream channel that runs through the central portion of the study area. A relatively narrow low flow channel (5 to 6 feet wide in most reaches) flows through the site in a westerly and southwesterly direction. The channel was dry at the time of the August 2014 site visit. Large trees, including valley oak and Fremont cottonwood, and shrubs, including Goodding's black willow and Himalayan blackberry, are abundant.

Seasonal wetlands occur in depressions between placer tailings where enough fine material has collected to impede the percolation of water. All of the seasonal wetlands observed were dry at the time of the August 2014 field assessment. They support curly dock (*Rumex crispus*), baltic rush (*Juncus balticus*), tall flatsedge (*Cyperus eragrostis*), common spikerush (*Eleocharis pachycarpa*), black sand spikerush, along with many other wetland generalist species.

Wildlife Occurrence and Use

The study area supports a wide diversity of wildlife due to the abundance of trees that provide roosting and nesting sites and escape and thermal cover. In addition, Strap Ravine provides a source of seasonal water for wildlife of the area and may be used as a movement corridor between suitable habitats located on- and offsite. Several snags occur throughout the site, particularly in areas along Strap Ravine. Cavities within snags and mature trees provide nesting sites for birds such as woodpeckers, bluebirds, nuthatches, American kestrel, and western screech owl. Taller trees of the site, including mature cottonwoods, gray pines, willows and oaks, provide suitable nesting habitat for raptors such as great horned owl, red-shouldered hawk, and Cooper's hawk.

The following animals were either observed directly or sign was observed throughout the study area during the August 2014 field assessment: acorn woodpecker (*Melanerpes formicivorus*), black phoebe (*Sayornis nigricans*), California quail (*Callipepla californica*), northern flicker (*Colaptes auratus*), white-breasted nuthatch (*Sitta carolinensis*), wild turkey (*Meleagris gallopavo*), oak titmouse (*Baeolophus inornatus*), spotted towhee (*Pipilo maculatus*), California towhee (*Pipilo crissalis*), Anna's hummingbird (*Calypte anna*), western scrub-jay (*Aphelocoma californica*), bushtit (*Psaltriparus minimus*), song sparrow (*Melospiza melodia*), Bewick's wren (*Thryomanes bewickii*), black-tailed jackrabbit (*Lepus californicus*), raccoon (*Procyon lotor*), and mule deer (*Odocoileus hemionus*). No surface water was present in the channel of Strap Ravine at the time of the August 2014 field assessment. However, a few Sierran treefrogs (*Psuedacris sierra*) were detected along the drainage and in the riparian area. One great-horned owl (*Bubo virginianus*) was observed roosting in a mature cottonwood near the seasonal wetland in the southeastern portion of the site. During the site visit an active acorn woodpecker granary was noted in the woodland located along Strap Ravine.

The Granite Bay Community Plan indicates that Strap Ravine is not likely to support anadromous salmonids, including Chinook salmon (*Oncorhynchus tshawytscha*) and steelhead (*Oncorhynchus mykiss irideus*) (Placer County 2012). Anadromous salmonids may be absent from Strap Ravine, including the reach that runs through the study area, due to low instream flows and previous channel disturbance. Nearby tributaries within the Dry Creek system that are known to support salmon and steelhead include Miner's

Ravine and Linda Creek (Placer County 2012; Placer County 2004). When flow is sufficient, portions of Strap Ravine may support resident trout and warm-water fish species.

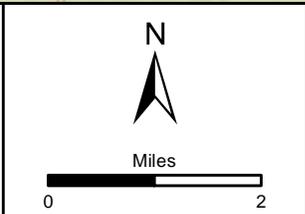

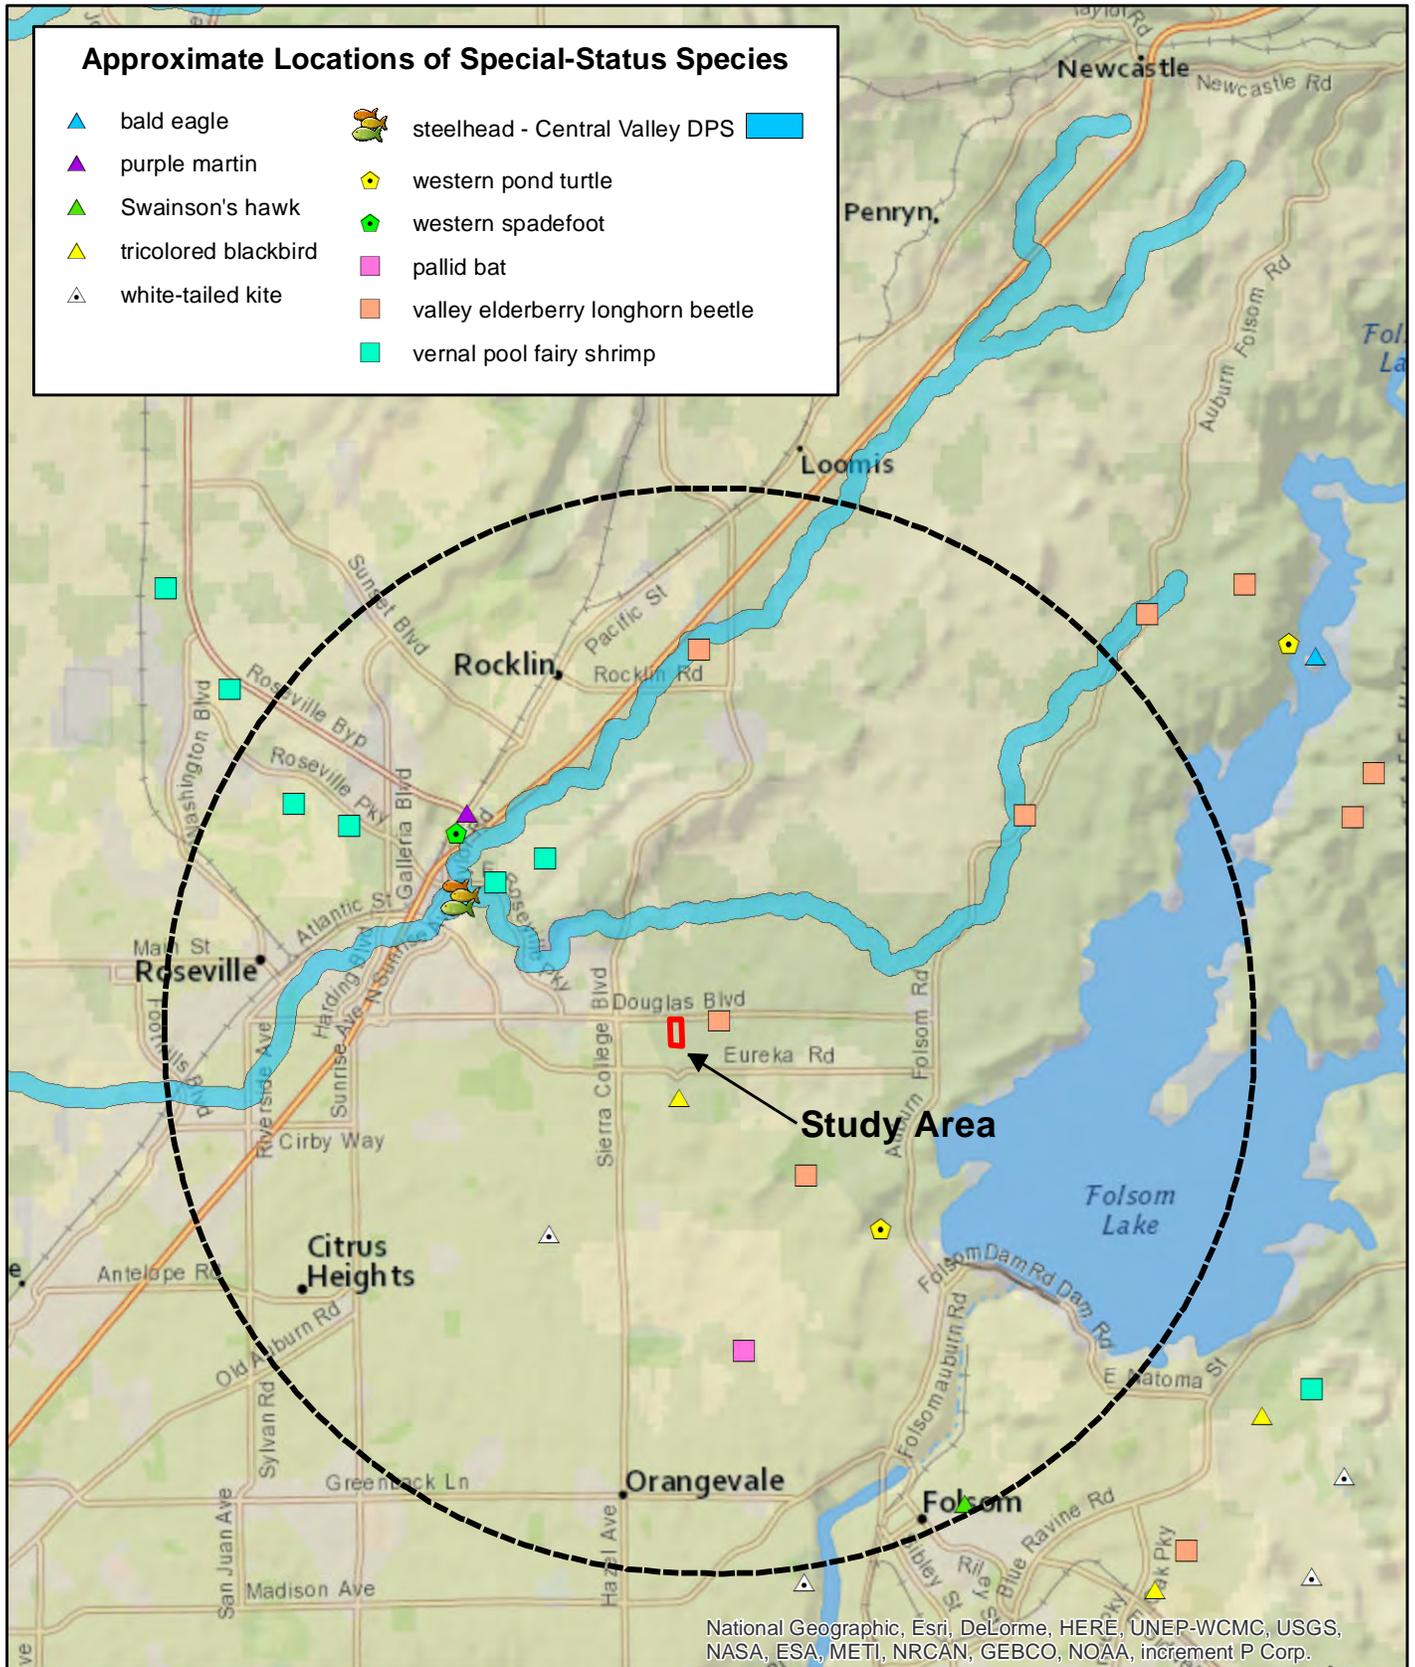

Although salmon are not expected to occur within Strap Ravine, the study area occurs within Hydrologic Unit 18020111, which is mapped as Essential Fish Habitat (EFH) for Chinook salmon (*Oncorhynchus tshawytscha*) (NOAA 2008). Under the Magnuson-Stevens Fishery Conservation and Management Act (MSA), Pacific Coast salmon EFH includes all water bodies occupied or historically accessible in Washington, Oregon, Idaho, and California that occur within selected USGS Hydrologic Units identified by the National Marine Fisheries Service (NOAA 2008). The MSA requires consultation with the National Marine Fisheries Service (NMFS) for projects that include a federal action or federal funding and may adversely modify EFH. If activities implemented within the study area will result in disturbance of Secret Ravine (mapped EFH) and require a permit from a federal agency (i.e., the Corps), consultation with NMFS may be required.

Special-Status Species

To determine potentially-occurring special-status species, the standard databases from the USFWS, CDFW (the CNDDDB), and CNPS were queried and reviewed. These searches provided a comprehensive list of regionally-occurring species and were used to determine which species have some potential to occur within or near the study area. Appendix C lists potentially-occurring special-status plants, and Appendix D lists special-status animals compiled from our queries as described above. The field survey and the best professional judgment of Salix biologists were used to further refine the tables in Appendices C and D. Additionally, plant species found on the CNPS List 3 and 4 are not considered further in the document. Figures 5 and 6 show approximate locations of reported occurrences of CNDDDB special-status wildlife and plants, respectively, within a five-mile radius of the study area.

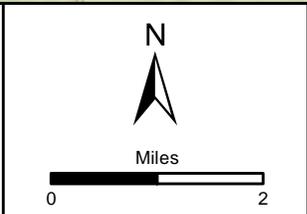

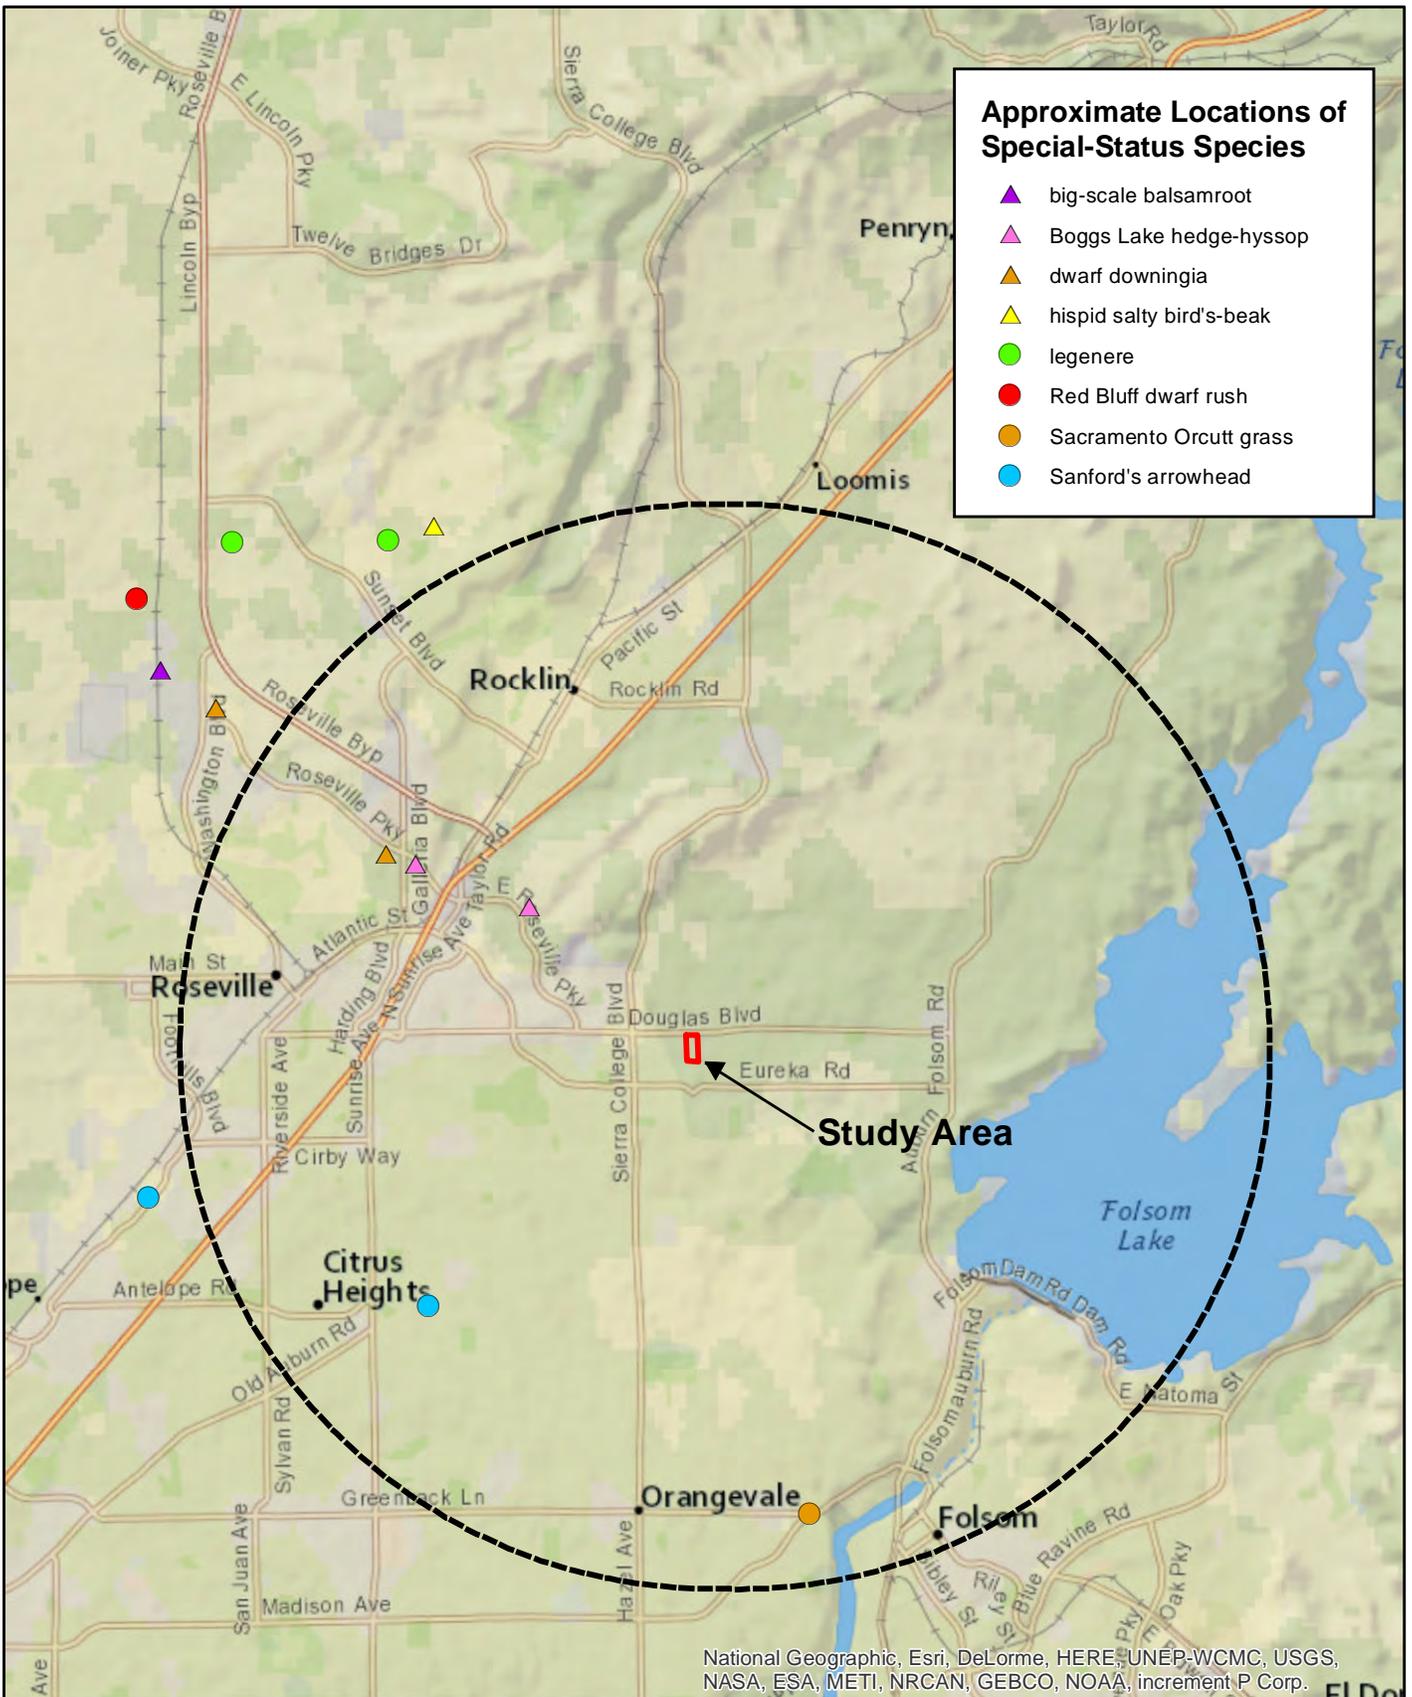

Of the 24 animal species in Appendix D, 11 were identified as occurring within the 5-mile radius of the study area (Figure 5). Five of the animal species occurring within the 5-mile radius, as well as 12 of the remaining species in Appendix D, were determined to have no potential for occurring onsite due to the absence of suitable aquatic habitats including perennial streams, ponds, vernal pools, or marshes. These are summarized in Table 2 below.

Of the 19 potentially-occurring plant species in Appendix C, eight were identified as occurring within the 5-mile radius of the study area (Figure 6). Six of the species occurring within the 5-mile radius, as well as the remainder of the potentially-occurring plant species (11 species) that do not occur within the 5-mile radius, were determined to have no potential for occurring onsite due to the absence of suitable habitat or substrates. These are summarized in Table 2 below.

Table 2 below provides a summary of the 17 plant species and 17 animal species determined to have no potential for occurring onsite.

Table 2. Special Status Species Determined to have NO POTENTIAL to Occur Within the Beaver Creek Study Area					
Species	Status*			Habitat	Reason for NO POTENTIAL to occur
	Federal	State	CNPS		
Plants					
Red Hills soaproot <i>Chlorogalum grandiflorum</i>	FSW	-	1B.2	Chaparral; cismontane woodland[serpentine or gabbroic].;	Site lacks gabbro/serpentine soils.
Boggs Lake hedge-hyssop <i>Gratiola heterosepala</i>	-	CE	1B.2	Marshes and swamps. Shallow water habitats and margins of vernal pools.	No suitable habitat present onsite.
Sacramento Orcutt grass <i>Orcuttia viscida</i>	FE	CE	1B.1	Vernal pools in valley grasslands of the Central Valley.	No suitable habitat present onsite.
Tuolumne button-celery <i>Eryngium pinnatisectum</i>	-	-	1B.2	Cismontane woodland; lower montane coniferous forest; vernal pools; [mesic].	Site lacks suitable habitat.
Layne's ragwort <i>Packera layneae</i>	FT	CR	1B.2	Chaparral; cismontane woodland [serpentine or gabbroic].	Site lacks gabbro/serpentine soils.
El Dorado County mules ears <i>Wyethia reticulata</i>	FE	CR	1B.2	Chaparral; cismontane woodland; [gabbroic or serpentine].	Site lacks gabbro/serpentine soils.
Dwarf downingia <i>Downingia pusilla</i>	-	-	2B.2	Valley and foothill grassland (mesic); vernal pools.	Site lacks suitable habitat.
Legenere <i>Legenere limosa</i>	-	-	1B.1	Vernal pools and similar wetlands.	Site lacks suitable habitat.
Stebbins' morning-glory <i>Calystegia stebbinsii</i>	FE	CE	1B.1	Chaparral (openings); cismontane woodland; [serpentine or gabbroic].	Site lacks gabbro/serpentine soils.
Ahart's dwarf rush <i>Juncus leiospermus ahartii</i>	-	-	1B.2	Vernal pools.	Site lacks suitable habitat.
Red Bluff dwarf rush <i>Juncus leiospermus leiospermus</i>	-	-	1B.1	Vernal pools and similar wetlands.	Site lacks suitable habitat.
Pine Hill flannelbush <i>Fremontodendron decumbens</i>	FE	CR	1B.2	Chaparral; cismontane woodland; [gabbroic or serpentine].	Site lacks gabbro/serpentine soils.
Hispid salty bird's-beak <i>Chloropyron molle hispidum</i>	-	-	1B.1	Meadows; playas; [alkaline].	Site lacks saline soils.

**Table 2.
Special Status Species Determined to have NO POTENTIAL to Occur Within the
Beaver Creek Study Area**

Species	Status*			Habitat	Reason for NO POTENTIAL to occur
	Federal	State	CNPS		
Bogg's Lake hedge-hyssop <i>Gratiola heterosepala</i>	-	CE	1B.2	Vernal pools	Site lacks suitable habitat.
Slender Orcutt grass <i>Orcuttia tenuis</i>	FT	CE	1B.1	Vernal pools	Site lacks suitable habitat.
Invertebrates					
Vernal pool fairy shrimp <i>Branchinecta lynchi</i>	FT	-	-	Vernal pools	No suitable aquatic habitat (vernal pools) present onsite.
Vernal pool tadpole shrimp <i>Lepidurus packardii</i>	FE			Vernal pools	No suitable habitat (vernal pools) present onsite.
Conservancy fairy shrimp <i>Brachinecta conseroatio</i>	FE			Vernal pools	No suitable habitat (vernal pools) present onsite.
Fish					
Central Valley spring-run Chinook salmon <i>Oncorhynchus tshawytscha</i>	FT	CT		Spring-run in Sacramento River. Primarily found in Butte, Big Chico, Deer, and Mill creeks and the Feather River tributaries	No suitable habitat present. Site located outside of species' range.
Delta smelt <i>Hypomesus transpacificus</i>	FT	CT		Endemic to the Sacramento-San Joaquin Delta in coastal and brackish waters.	No suitable habitat present. Located outside of species' range.
Amphibians					
California tiger salamander <i>Ambystoma californiense</i>	FT	CT		Annual grassland habitat (<1500 feet) and occasionally in grassy understory of valley-foothill hardwood habitats where lowland aquatic sites are available for breeding. Breeds primarily in vernal pools.	No suitable habitat present onsite or in surrounding area. No known occurrences in Placer County.
California red-legged frog <i>Rana draytonii</i>	FT	SSC	-	Ponds along streams with emergent or overhanging vegetation.	No suitable habitat present onsite. Only one documented occurrence in Placer County.

**Table 2.
Special Status Species Determined to have NO POTENTIAL to Occur Within the
Beaver Creek Study Area**

Species	Status*			Habitat	Reason for NO POTENTIAL to occur
	Federal	State	CNPS		
Western spadefoot <i>Spea hammondi</i>	-	SSC	-	Requires vernal pools, seasonal wetlands, or stock ponds for breeding in grassland, sandy washes, or open woodlands.	None. No suitable aquatic breeding habitat observed. Generally known from seasonal wetlands in valley floor to west.
Reptiles					
Giant garter snake <i>Thamnophis gigas</i>	FT	CT		Primarily associated with marshes and sloughs, less with slow-moving creeks, and absent from larger rivers.	No suitable aquatic habitat present onsite or in the surrounding region. No known occurrences in region.
Birds					
Bald eagle <i>Haliaeetus leucocephalus</i>		CE, CFP		Occurs along shorelines, lake margins, and rivers. Nests in large old-growth or dominant trees with open branches.	No suitable nesting or foraging habitat present onsite.
Swainson's hawk (nesting) <i>Buteo swainsoni</i>	-	CT	-	Riparian woodlands and oak savannah with adjacent grassland or agricultural fields, generally in the Central Valley	No suitable nesting or foraging habitat onsite or in vicinity. Site located outside of typical range of species.
Golden eagle <i>Aquila chrysaetos</i>		CFP		Found in rolling foothill grassland with scattered trees. Nests on cliffs and in large trees in open areas.	No suitable nesting habitat present onsite.
Burrowing owl <i>Athene cunicularia</i>		SSC		Primarily Central Valley grasslands. Nests in burrows dug by small mammals, primarily ground squirrels.	No suitable habitat present onsite.
Bank swallow <i>Riparia riparia</i>		CT		Colonial nester near riparian and other lowland habitats. Requires vertical banks or cliffs with fine-textured, sandy soils near streams, rivers, and lakes.	No suitable nesting habitat present onsite.

**Table 2.
Special Status Species Determined to have NO POTENTIAL to Occur Within the
Beaver Creek Study Area**

Species	Status*			Habitat	Reason for NO POTENTIAL to occur
	Federal	State	CNPS		
Grasshopper sparrow <i>Ammodramus savannarum</i>		SSC		Breeds in grasslands and savannahs in rolling hills and lower mountain hillsides up to 5000 feet elevation.	No suitable nesting habitat. Prefers expansive areas of grassland for nesting.
Mammals					
Pallid bat <i>Antrozous pallidus</i>	-	SSC	-	Open, dry areas with rocky outcrops for roosting.	No suitable roosting habitat present on site. No structures or significant rock features to support roosting of species.
American badger <i>Taxidea taxus</i>		SSC		Occurs in dry, open soils in herbaceous, shrub, and forest habitats. Needs friable, uncultivated soil. Preys on rodents.	No suitable habitat. No evidence of species occurrence observed.

***Status Codes:**

2- Fairly threatened in California

Table 3 below provides a summary of those species that have been determined to have some potential to occur within the study area based on the analysis of potential to occur presented in Appendices C and D. Discussions for the identified species are provided following Table 3.

**Table 3.
Special Status Species Determined to Have SOME POTENTIAL to Occur Within
Beaver Creek Study Area**

Species	Status*			Habitat	Potential for Occurrence Within Study Area**
	Federal	State	CNPS		
Plants					
Big-scale balsamroot <i>Balsamorhiza macrolepis</i> <i>var. macrolepis</i>	-	-	1B.2	Valley grassland and foothill woodland. Often on serpentine	Unlikely. Marginal habitat occurs onsite.
Sanford's arrowhead <i>Sagittaria sanfordii</i>	-	-	1B.2	Marshes and slow moving water.	Unlikely. Marginal habitat only in areas that sustain shallow water well into the dry season.
Invertebrates					
Valley elderberry longhorn beetle <i>Desmocerus californicus dimorphus</i>	FT	-	-	Elderberry shrubs	Unlikely. No elderberry shrubs observed onsite in 2014 (see comments below in text)
Fish					
Steelhead - Central Valley DPS <i>Oncorhynchus mykiss irideus</i>	FT	-	-	Sacramento River and tributaries including portions of Dry Creek system (Secret Ravine and Miner's Ravine).	Unlikely. Strap Ravine provides marginal quality habitat for species. Known occurrences throughout Dry Creek system.
Reptiles					
Western pond turtle <i>Emys marmorata</i>	-	SSC	-	Permanent aquatic habitats with suitable basking sites and adjacent upland habitat.	Unlikely. No suitable aquatic habitat present within the study area. May use portions of Strap Ravine as a movement corridor between suitable habitats located offsite.

**Table 3.
Special Status Species Determined to Have SOME POTENTIAL to Occur Within
Beaver Creek Study Area**

Species	Status*			Habitat	Potential for Occurrence Within Study Area**
	Federal	State	CNPS		
Birds					
Tricolored blackbird (nesting colonies) <i>Agelaius tricolor</i>	-	SSC	-	Requires open accessible water through nesting season, a protected nesting substrate, and nearby foraging areas. Nests in cattails, tules or blackberry thickets	Unlikely. Marginal quality nesting habitat available on site. Limited amount of open foraging habitat available.
White-tailed kite (nesting) <i>Elanus leucurus</i>	-	CFP	-	Open grassland, meadows, and farmlands. Nests in tall trees near foraging areas.	Unlikely. Prefers nesting closer to larger tracts of open foraging habitat.
California black rail <i>Laterallus jamaicensis coturniculus</i>	-	CT CFP	-	In the Sierra Nevada foothills, occurs in freshwater emergent wetlands with shallow persistent water.	Unlikely. Marginal quality habitat present onsite. Wetlands lack persistent shallow water preferred by the species.
Purple martin (nesting) <i>Progne subis</i>	-	SSC	-	Summer visitor of woodlands and low-elevation coniferous forests.	Unlikely. Prefers large trees with cavities on hillsides and along ridgetops.

*Status Codes:

Federal

FE Federal Endangered
FT Federal Threatened

State

CE California Endangered
CT California Threatened
SSC California Species of Concern

CNPS

Rank 1B Rare, Threatened, or Endangered in California
Rank 2 R, T, or E in California, more common elsewhere
1- Seriously threatened in California

**Definitions for the Potential to Occur:

Unlikely: Minimal or marginal quality habitat in the study area.

Possible. Suitable habitat occurs within the study area.

Likely. Study area provides desirable habitat for species and there is a very high probability for its occurrence.

Observed: Species was observed within the study area.

Plants

Several special-status plants are known from the surrounding project region and are shown in Figure 5. All but two of the species require habitats that do not occur within the study area and therefore were eliminated from further consideration. As summarized in Table 2, the following species shown in Figure 5 occur in either vernal pools or saline marsh habitats in the Central Valley, generally to the west of the study

area: Boggs Lake hedge-hyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), hispid bird's-beak (*Chloropyron molle* ssp. *hispidium*), legenera (*Legenera limosa*), Red Bluff dwarf rush (*Juncus leiospermus* var. *leiospermus*), and Sacramento Orcutt grass (*Orcuttia viscida*). Based on the absence of suitable habitat, these species were determined to have no potential for occurring on site.

The project site contains marginal habitat for two special-status plant species (Table 3); both are discussed below.

Big-scale balsamroot (*Balsamorhiza macrolepis* var. *macrolepis*) is considered “unlikely” to occur due to the presence of only marginal quality habitat. Big-scale balsamroot is an herbaceous perennial member of the sunflower family (Asteraceae). It has no state or federal status, but has a California Rare Plant Rank of 1B.2. This species has large yellow flowering heads and leaves that arise from the ground. It differs, in part, from other balsamroots by having coarsely serrate leaves. Big-scale balsam-root grows in open woodlands and grasslands at widely scattered locations in Northern California. It blooms from March to June.

No members of the genus *Balsamorhiza* or similar genus *Wyethia*, were observed during the August 2014 field assessment nor during the 2004 surveys. The nearest recorded occurrence of big-scale balsam-root is from approximately 6 to 7 miles northwest of the site just west of Highway 65, between Roseville and Lincoln. Because only marginal quality habitat is present onsite and occurrence of the species is rare in the region, it is unlikely that big-scale balsam root occurs within the study area.

Sanford's arrowhead (*Sagittaria sanfordii*) is an herbaceous perennial member of the water-plantain family (Alismataceae). It has no state or federal status, but has a CNPS Rare Plant Rank of 1B.2 Preferred habitat includes marshes associated with slow-moving water in sloughs and ditches. It is also known to occur in concrete lined channels with only a few inches of soil. It has a long blooming period, starting as early as May and occasionally lasting through September.

No individuals of *Sagittaria* were observed during the August 2014 field assessment. The closest recorded occurrence of this species is from approximately 3 to 4 miles to the southwest in the Citrus Heights area (CNDDDB 2014). This species was documented at this location in 1997 in a cattail-dominated freshwater marsh. Because only marginal habitat is present in areas that sustain shallow water well into the dry season, it is unlikely that Sanford's arrowhead occurs within the study area.

Wildlife

Of the 24 special-status animals identified through the database searches and other literature as occurring within the broader region surrounding the study area, none were determined to have a reasonable potential for occurring onsite. Many species were determined to have no potential for occurring within the study area due to the absence of suitable habitat or due to the site being located outside of the current range of a species (Table 2). In particular, the site lacks vernal pools, which support the Federal Threatened vernal pool fairy shrimp (*Branchinecta lynchi*), the Federal Endangered vernal

pool tadpole shrimp (*Lepidurus packardii*), and the western spadefoot (*Spea hammondi*), a California Species of Special Concern (SSC). These species are generally known from vernal pools located in open habitats of the Central Valley to the west and northwest. Swainson's hawk (*Buteo swainsonii*), a California threatened species, generally nests in riparian woodland habitats and oak savannah of the Central Valley, often near water. Nesting sites are usually located in isolated trees in open country within several miles of suitable foraging habitat. The study area occurs outside of the typical range of the species and does not provide suitable foraging or nesting habitat. Bald eagles (*Haliaeetus leucocephalus*) require large bodies of water, or free-flowing rivers with nearby perches, including snags, large-limbed tall trees, or rocks near water. Due to the lack of suitable nesting and foraging sites, this species is not expected to occur within the study area. There are no structures within the study area or significant rock features that would support roosting of special-status bats known from the region including pallid bat (*Antrozous pallidus*), a SSC species.

California red-legged frog (*Rana draytonii*), a federally threatened species and SSC species, prefers aquatic habitats with little or no flow, the presence of surface water for most of the year, surface water depths to at least 0.7 meter (2.3 feet), and the presence of fairly sturdy underwater supports such as cattails. Only isolated populations of California red-legged frog (CRLF) have been documented in the Sierra Nevada foothills region (USFWS 2002). The closest documented occurrence is from approximately 7 miles east of the study area, in the foothills along the east side of Folsom Lake (CDFW 2014). In addition, existing literature indicates that CRLF was likely extirpated from the floor of the Central Valley prior to the 1960s (USFWS 2002). Due to the lack of habitat and the study area occurring outside of the current range of the species, there is no potential for occurrence of California red-legged frog onsite.

Several of the identified animal species were ranked as "unlikely to occur" (Table 3); none were ranked as "Possible," "Likely," or "Occurs." The discussions below include these species or those that require further clarification.

Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) is a federal threatened species. Live elderberry shrubs (*Sambucus nigra ssp. caerulea*) are this borer's exclusive host plant. Adult valley elderberry longhorn beetles (VELB) emerge from pupation inside the wood of these shrubs in the spring as their flowers begin to open. Exit holes made by the emerging adults are distinctive small oval openings (approx. ¼-inch width). Elderberry shrubs that contain live stems of one inch or greater at ground level (USFWS 1999) are considered potential habitat for the species by the U.S. Fish and Wildlife Service. Elderberry plants with no stems measuring 1.0 inch or greater at ground level are not considered habitat for the beetle. No suitable habitat for VELB (live elderberry shrubs) was observed during previous surveys (NFA 2004b) or during the recent 2014 field assessment within the study area. The absence of elderberry shrubs to date precludes the occurrence of VELB within the study area at this time; however, there is potential for new elderberry shrubs to grow and establish in the future and subsequently provide habitat for VELB. Based on the absence of elderberries, there is currently no suitable habitat for VELB present within the study area. In the event that elderberries become established onsite at any time in the future and stems grow to 1.0 inch or greater, occurrence of VELB would be possible.

Central Valley Steelhead (*Oncorhynchus mykiss irideus*) is an anadromous form of rainbow trout that emigrates to sea and later returns to freshwater to spawn. Steelhead spawn in winter or early spring after salmon have typically spawned. They often require high water to provide access to upper watershed and spawning and rearing areas. Spawning occurs in clean, loose gravels and swift, shallow water. They generally prefer shallower stream depths and smaller gravel than salmon, but prefer similar water velocities. Juvenile steelhead often remain in freshwater for at least one year before out-migrating to the ocean. While in freshwater, young steelhead are typically found in cool, fast-flowing permanent streams and rivers where riffles predominate over pools and there is ample riparian and instream cover (NMFS 2009).

The CNDDDB (2014) documents steelhead as occurring in the Dry Creek system, mainly in two of its tributaries to the north including Secret Ravine and Miner's Ravine. Although steelhead are documented as occurring within the Dry Creek Watershed, the Granite Bay Community Plan indicates that Strap Ravine is not expected to provide suitable habitat for anadromous salmonids, including steelhead (Placer County 2012). Nearby tributaries that are known to provide suitable steelhead habitat include Miner's Ravine and Linda Creek, which is located downstream of Strap Ravine (Placer County 2004). The portion of Strap Ravine within the study area does not provide suitable rearing habitat for steelhead due to the absence of perennial surface water and pools, and may only be used seasonally as a migration corridor if steelhead are present within the drainage and there are no barriers to their movement.

Strap Ravine is not mapped as Critical Habitat for Central Valley Steelhead (Federal Register 2005). The closest mapped Critical Habitat unit for central valley steelhead is the mainstem of Dry Creek and two of its tributaries to the north, Miner's Ravine and Secret Ravine (NOAA 2005). Therefore, no designated critical habitat for this species occurs within or adjacent to the study area.

Western pond turtle (*Emys marmorata*), a SSC species, occurs in association with streams, rivers, and ponds containing suitable cover and basking sites. This species is normally associated with ponds, streams, lakes, marshes, and permanent pools along intermittent streams. Suitable basking sites along streams or ponds include partially submerged logs, rocks, mats of floating vegetation, or open streambanks. Suitable upland habitat, such as sandy banks or grassy fields, located adjacent to the aquatic habitat is required for egg-laying. Nesting takes place in a variety of soil types from loose sandy soils to compact soils, and in a variety of habitat types.

Suitable habitat for western pond turtle, consisting of ponds or deeper pools along streams, does not occur within the study area. The channel of Strap Ravine within the study area is very shallow and lacks the perennial deep pool habitat that pond turtles require. Any occurrence of pond turtles within the study area would be limited to individuals that periodically move up or downstream between suitable aquatic habitats located offsite.

Tricolored blackbird (*Agelaius tricolor*) is a highly colonial species that primarily nests in freshwater emergent wetlands. Nesting colonies of this species are considered sensitive by CDFW. This species generally requires open water, with protected nesting habitat, and suitable foraging areas close to the colony. Breeding and nesting typically takes

place in dense cattails or tules, and may also occur in thickets of willow, blackberry, wild rose, and tall herbs (Shuford and Gardali 2008). Nest sites are usually located a few feet over, or near, freshwater. Nesting areas must be large enough to support a minimum colony of about 50 pairs. Colonies may vary in size from about 50 nests to over 20,000 in an area of 10 acres or less. Nesting typically occurs mid-April through late July.

The CNDDDB documents nesting colonies of tri-colored blackbird within a 5-mile radius of the study area (CDFW 2014). The closest documented occurrence is from approximately one mile southwest just south of Eureka Road. The blackberry thickets present within the study area, primarily along Strap Ravine, provide suitable nesting substrate for the species, but the amount of suitable foraging habitat available nearby is limited. Due to the low quality of habitat available for the species, it is unlikely that tricolored blackbird would nest within the study area.

White-tailed kite (*Elanus leucurus*), a California fully protected species, is an uncommon to locally fairly common resident and is typically found in grassy foothill slopes interspersed with oaks (including interior live oak, agricultural areas, and marshy bottomlands). They generally forage in undisturbed open grasslands, farmlands, meadows, and emergent wetlands, in areas with a high prey base. Nest trees range from single isolated trees to trees within larger stands. Nests of white-tailed kite are constructed near the top of oaks, willows, or other tall trees from 20 to 100 feet above ground. Nesting activity takes place from February through summer.

The CNDDDB documents nesting occurrences of white-tailed kite within the project region (CDFW 2014). The closest documented nesting occurrence is from approximately 2 miles to the southwest. Woodland areas located throughout the site provide marginal quality nesting habitat for white-tailed kite due to the limited amount of open foraging habitat (open woodland and annual grassland) in the surrounding area.

California black rail (*Laterallus jamaicensis coturniculus*) is a scarce and secretive resident bird that occurs in saline, brackish, and freshwater wetlands (Zeiner et al. 1990). Once mainly known from tidal marshes in the San Francisco Bay, it has recently been found in the Sierra Nevada foothills (Beedy and Pandolfino 2013). In the foothills region, it is known to occur in wetlands with dense emergent vegetation, such as cattails and bulrush, and having shallow, consistent water levels, often from irrigation or leaky canals. These birds regularly move around to new sites in response to changes in local conditions. Nesting generally takes place from mid-March through early June.

There are no documented occurrences of California black rail within a 5-mile radius of the study area (CNDDDB 2014). The closest documented occurrence of this species is from the north in a large, cattail-dominated wetland associated with Clover Valley Creek (2006). The seasonal wetlands, wetland swale, and riparian corridor of the study area do not provide habitat components considered suitable for the species (shallow, persistent surface water and dense emergent vegetation). Based on the marginal quality of habitat available and the rarity of the species within the region, it is unlikely California black rail would occur in wetlands of the study area.

Purple martin (*Progne subis*) is an uncommon to rare breeder in the Sierra Nevada and foothill region. This species nests in large trees with sizable cavities generally found along ridgetops or on hillsides. Nesting typically occurs from April to August, with peak activity in June. The study area does not provide preferred habitat for purple martin and therefore nesting is unlikely to occur.

RECOMMENDATIONS

Waters of the United States

The study area contains areas that qualify as waters of the United States. Activities that place fill in these areas would require a permit from the U.S. Army Corps of Engineers pursuant to Section 404 of the federal Clean Water Act. The project would also need to obtain a water quality certification from the California Regional Water Quality Control Board pursuant to Section 401 of the federal Clean Water Act.

Streams, Pond, and Riparian Habitat

Impacts to the bed, bank, or channel of streams or ponds require a Streambed Alteration Agreement with the California Department of Fish and Wildlife (CDFW). In addition, Strap Ravine occurs within a hydrologic unit (HUC 20820111) considered Essential Fish Habitat for Chinook salmon by the National Marine Fisheries Service (NMFS). The Magnuson-Stevens Fishery Conservation and Management Act requires consultation with NMFS for projects that include a federal action or federal funding that may adversely modify EFH. Generally, EFH consultation involves a federal agency notifying NMFS regarding an action that may affect EFH, such as in the issuance of a Section 404 permit.

The Granite Bay Community Plan (Placer County 2012) identifies measures for protecting natural resources throughout the community. Policy 5.3.11 specifies that “new construction shall not be permitted within 100 feet of the centerline of permanent streams and 50 feet of intermittent streams, or within the 100 year floodplain, whichever is greater.” Other measures for protecting wetlands, riparian areas, and other sensitive habitats onsite are identified in Section 5.3 of the Granite Bay Community Plan.

Tree Conservation

Policy 5.3.15 of the Granite Bay Community Plan requires that Placer County’s Tree Preservation Ordinance be implemented for all projects within the community of Granite Bay (Placer County 2012). The Tree Preservation Ordinance specifies requirements for the protection, preservation, and maintenance of native oak trees, trees of historic or cultural significance, groves and stands of mature trees, and mature trees in general, which are associated with proposals for development. The applicant should consult with the Placer County Planning Department to determine what provisions of the ordinance are applicable.

Special-Status Plants

The site contains marginal habitat for big-scale balsam-root and Sanford's arrowhead. Because both of these species are CNPS Rank 1B species, Placer County may require surveys to determine if any individuals are present on site. Should any individual special-status plant species be located within the study area, appropriate mitigation measures shall be developed in coordination with the Placer County Planning Department.

Special-Status Wildlife

Pre-Construction Nesting Surveys

Foothill woodland throughout the site provides suitable nesting habitat for common raptors known from the region, such as red-shouldered hawk, Cooper's hawk, and a few owls. Suitable raptor nesting habitat includes mature pines, oaks, willows, and cottonwoods scattered throughout the site. If tree removal activities take place during the associated breeding/nesting season for raptors (typically March 1 through August 31), disturbance of nesting activities could occur. Take of any active raptor nest is prohibited under California Fish and Game Code Section 3503.5. To avoid take of active raptor nests, necessary tree removal should occur outside of the typical nesting season for raptors and other bird species. If tree removal must occur at any time during the typical nesting season, a pre-construction survey should be conducted by a qualified biologist no more than 30 days prior to initiation of proposed development activities. Pre-construction surveys will focus on all raptors having potential to occur onsite, including those with minimal potential for occurrence (white-tailed kite for this site). If active nests are found on or immediately adjacent to the site, CDFW should be contacted to determine appropriate avoidance measures. If no nesting is found to occur, necessary tree removal could then proceed.

The quality of habitat available for purple martin, tricolored blackbird, and California black rail within the study area is considered marginal, and consequently, the potential for occurrence is very low. Although nesting of these species within the study area is highly unlikely, implementation of pre-construction surveys is recommended to avoid any potential disturbance of these species, should they occur onsite. Take or destruction of an active nest is prohibited under California Fish and Game Code Section 3503. Pre-construction surveys should be implemented by a qualified biologist if ground disturbance occurs at any time during the nesting season (generally March through August). If no nesting activity is detected within proposed work areas, construction activities could then proceed. If, however, active nests are found, construction should be avoided until after the young have fledged or upon approval from CDFW.

Additional Avoidance Measures

The study area lacks perennial pools and ponds preferred by western pond turtle, and therefore, any occurrence would be limited to individuals moving up or down the drainage between suitable habitats located off site. Although occurrence of western pond turtle is unlikely, implementation of Policy 5.3.11 of the Granite Bay

Community Plan (stream setbacks) would limit disturbance of any individual pond turtles that may use Strap Ravine as a movement corridor.

Strap Ravine is not likely to support steelhead due to the limited amount and low quality of habitat available throughout the drainage. It is unknown if barriers occur downstream that would prevent this species from making it upstream to the project site. In the unlikely event steelhead occur in the drainage, the portion of Strap Ravine within the study area would only be used as migration corridor when flows are sufficient. Implementation of Policy 5.3.11 of the Granite Bay Community Plan (stream setbacks) would limit disturbance of potential habitat for steelhead along Strap Ravine.

Appendix A.
Plant Species Observed Within the Beaver Creek Study Area

Appendix A

Plants Observed - Beaver Creek - 2014

Ferns and Allies

Pteridaceae - Brake Family

Pentagramma triangularis subsp. triangularis Goldback fern

Gymnosperms

Pinaceae - Pine Family

Pinus sabiniana Gray pine

Angiosperms - Dicots

Anacardiaceae - Cashew or Sumac Family

Toxicodendron diversilobum Western poison-oak

Apiaceae (Umbelliferae) - Carrot Family

**Anthriscus caucalis* Bur-chervil
 **Foeniculum vulgare* Sweet fennel
Sanicula bipinnatifida Purple sanicle
Sanicula crassicaulis Gamble weed
 **Torilis arvensis* Field hedgeparsley

Apocynaceae - Dogbane/Milkweed Family

Asclepias fascicularis Narrow-leaf milkweed

Aristolochiaceae - Pipevine Family

Aristolochia californica California pipevine

Asteraceae (Compositae) - Sunflower Family

Ambrosia psilostachya Western ragweed
Artemisia douglasiana California mugwort
Baccharis glutinosa Marsh baccharis
Baccharis pilularis Coyote brush
Bidens frondosa Sticktight
 **Carduus pycnocephalus* Italian thistle
 **Centaurea solstitialis* Yellow starthistle
 **Chondrilla juncea* Skeleton weed
 **Cichorium intybus* Chicory
 **Cirsium vulgare* Bull thistle
Euthamia occidentalis Western goldenrod
Holocarpha virgata subsp. virgata Virgate tarweed
 **Hypochaeris glabra* Smooth cat's-ear
 **Lactuca serriola* Prickly lettuce
Micropus californicus var. californicus Cottontop
 **Senecio vulgaris* Common groundsel
 **Sonchus asper subsp. asper* Prickly sow-thistle
 **Tragopogon dubius* Yellow salsify
Wyethia angustifolia Narrowleaf mule's-ears
Xanthium strumarium Cocklebur

* Indicates a non-native species

Brassicaceae (Cruciferae) - Mustard Family

- **Hirschfeldia incana* Short-podded mustard
- **Raphanus sativus* Wild radish

Caprifoliaceae - Honeysuckle Family

- Symphoricarpos mollis* Creeping snowberry

Caryophyllaceae - Pink Family

- **Cerastium glomeratum* Sticky mouse-ear chickweed
- **Petrorhagia dubia* Grass-pink
- **Stellaria media* Common chickweed

Convolvulaceae - Morning-Glory Family

- **Convolvulus arvensis* Bindweed

Cucurbitaceae - Gourd Family

- Marah fabacea* California manroot

Euphorbiaceae - Spurge Family

- Croton setiger* Turkey mullein

Fabaceae (Leguminosae) - Legume Family

- Acmispon americanus* var. *americanus* Spanish-clover
- Lupinus bicolor* Miniature lupine
- **Medicago polymorpha* California burclover
- **Trifolium hirtum* Rose clover
- **Vicia villosa* Winter vetch

Fagaceae - Oak Family

- Quercus douglasii* Blue oak
- Quercus lobata* Valley oak
- Quercus wislizeni* var. *wislizeni* Interior live oak

Gentianaceae - Gentian Family

- Zeltnera muehlenbergii* June centaury

Geraniaceae - Geranium Family

- **Erodium botrys* Broad-leaf filaree
- **Erodium cicutarium* Red-stem filaree
- **Geranium dissectum* Cut-leaf geranium
- **Geranium molle* Dove's-foot geranium

Hypericaceae - St. John's Wort Family

- **Hypericum perforatum* subsp. *perforatum* Klamathweed

Lamiaceae (Labiatae) - Mint Family

- **Lamium amplexicaule* Deadnettle
- **Marrubium vulgare* White horehound
- **Mentha pulegium* Pennyroyal
- Stachys ajugoides* Bugle hedge-nettle

Lythraceae - Loosestrife Family

- **Lythrum hyssopifolia* Hyssop loosestrife

Montiaceae - Miner's Lettuce Family

- Calandrinia ciliata* Red maids
- Claytonia perfoliata* Common miner's lettuce

Oleaceae - Olive Family

- **Olea europaea* Olive

Onagraceae - Evening Primrose Family

- Clarkia purpurea* subsp. *purpurea* Purple clarkia

Appendix C.
Potentially-Occurring Special-Status Plants in the Region of the Beaver Creek Study Area

Appendix C
Potentially-Occurring Special-Status Plants - Beaver Creek

Family Taxon Common Name	Status*	Flowering Period	Habitat	Probability on Project Site
Agavaceae				
<i>Chlorogalum grandiflorum</i> Red Hills soaproot	Fed: FSW State: - CNPS: Rank 1B.2	May-June	Chaparral; cismontane woodland; [serpentinite or gabbroic].	None. Site lacks gabbro/serpentine soils.
Alismataceae				
<i>Sagittaria sanfordii</i> Sanford's arrowhead	Fed: - State: - CNPS: Rank 1B.2	May-October	Marshes and swamps (assorted shallow freshwater).	Unlikely. Marginal habitat in areas that sustain shallow water well into the dry season.
Apiaceae (Umbelliferae)				
<i>Eryngium pinnatisectum</i> Tuolumne button-celery	Fed: - State: - CNPS: Rank 1B.2	June-August	Cismontane woodland; lower montane coniferous forest; vernal pools; [mesic].	None. Site lacks suitable habitat.
Asteraceae (Compositae)				
<i>Balsamorhiza macrolepis</i> Big-scale balsam-root	Fed: - State: - CNPS: Rank 1B.2	March-June	Cismontane woodland; valley and foothill grassland; [sometimes serpentinite].	Unlikely. Marginal habitat present. Known from a few locations in the region.
<i>Packera layneae</i> Layne's ragwort	Fed: FT State: CR CNPS: Rank 1B.2	April-July	Chaparral; cismontane woodland; [serpentinite or gabbroic].	None. Site lacks gabbro/serpentine soils.
<i>Wyethia reticulata</i> El Dorado County mules ears	Fed: - State: - CNPS: Rank 1B.2	May-July	Chaparral; cismontane woodland; lower montane coniferous forest; [clay or gabbroic].	None. Site lacks gabbro/serpentine soils.

Appendix C
Potentially-Occurring Special-Status Plants - Beaver Creek

Family Taxon Common Name	Status*	Flowering Period	Habitat	Probability on Project Site
Campanulaceae				
<i>Downingia pusilla</i> Dwarf downingia	Fed: - State: - CNPS: Rank 2B.2	March-May	Valley and foothill grassland (mesic); vernal pools.	None. Site lacks suitable habitat.
<i>Legenere limosa</i> Legenere	Fed: - State: - CNPS: Rank 1B.1	April-June	Vernal pools and similar wetlands.	None. Site lacks suitable habitat.
Convolvulaceae				
<i>Calystegia stebbinsii</i> Stebbins' morning-glory	Fed: FE State: CE CNPS: Rank 1B.1	May-June	Chaparral (openings); cismontane woodland; [serpentinite or gabbroic].	None. Site lacks gabbro/serpentine soils.
Juncaceae				
<i>Juncus leiospermus ahartii</i> Ahart's dwarf rush	Fed: - State: - CNPS: Rank 1B.2	March-May	Vernal pools.	None. Site lacks suitable habitat.
<i>Juncus leiospermus leiospermus</i> Red Bluff dwarf rush	Fed: - State: - CNPS: Rank 1B.1	March-May	Chaparral; cismontane woodland; valley and foothill grassland; vernal pools; [vernally mesic].	None. Site lacks suitable habitat.
Malvaceae				
<i>Fremontodendron decumbens</i> Pine Hill flannelbush	Fed: FE State: CR CNPS: Rank 1B.2	April-June	Chaparral; cismontane woodland; [gabbroic or serpentinite].	None. Site lacks gabbro/serpentine soils.

Appendix C
Potentially-Occurring Special-Status Plants - Beaver Creek

Family Taxon Common Name	Status*	Flowering Period	Habitat	Probability on Project Site
Orobanchaceae				
<i>Chloropyron molle hispidum</i> Hispid salty bird's-beak	Fed: - State: - CNPS: Rank 1B.1	June-September	Meadows; playas; [alkaline]. 1-155m.	None. Site lacks saline soils.
Plantaginaceae				
<i>Gratiola heterosepala</i> Bogg's Lake hedge-hyssop	Fed: - State: CE CNPS: Rank 1B.2	April-August	Marshes and swamps (lake margins); vernal pools. Below 1200 m.	None. Site lacks suitable habitat.
Poaceae (Gramineae)				
<i>Orcuttia tenuis</i> Slender Orcutt grass	Fed: FT State: CE CNPS: Rank 1B.1	May-September	Vernal pools.	None. Site lacks suitable habitat.
<i>Orcuttia viscida</i> Sacramento Valley Orcutt grass	Fed: FE State: CE CNPS: Rank 1B.1	May-June	Vernal pools.	None. Site lacks suitable habitat.
Polemoniaceae				
<i>Navarretia myersii myersii</i> Pincushion navarretia	Fed: - State: - CNPS: Rank 1B.1	May-May	Vernal pools.	None. Site lacks suitable habitat.
Rhamnaceae				
<i>Ceanothus roderickii</i> Pine Hill ceanothus	Fed: FE State: CR CNPS: Rank 1B.1	May-June	Chaparral; cismontane woodland; [serpentinite or gabbroic].	None. Site lacks gabbro/serpentine soils.

Appendix D.
Potentially-Occurring Special-Status Animals in the Region of the Beaver Creek
Study Area

Appendix D
Potentially-Occurring Special-Status Wildlife- Beaver Creek

	Status*	Habitat	Probability on Project Site
Invertebrates			
Vernal pool fairy shrimp <i>Branchinecta lynchi</i>	Fed: FT State: - Other: -	Vernal pools and other temporary bodies of water in southern and Central Valley of California. Most common in smaller grass or mud bottomed swales or basalt flow depression pools in unplowed grasslands.	None. No suitable habitat (vernal pools) present onsite. Known mainly from valley floor to west.
Vernal pool tadpole shrimp <i>Lepidurus packardii</i>	Fed: FE State: - Other: -	Found in vernal pools in the Central Valley of California and in the San Francisco Bay area. Inhabits vernal pools with clear to highly turbid water.	None. No suitable habitat (vernal pools) present onsite.
Conservancy fairy shrimp <i>Brachinecta conservatio</i>	Fed: FE State: - Other: -	Endemic to the Central Valley and southern coastal regions of California. Prefers larger, turbid, cool-water vernal pools located in alluvial swales.	None. No suitable habitat (vernal pools) present onsite.
Insects			
Valley elderberry longhorn beetle <i>Desmocerus californicus dimorphus</i>	Fed: FT State: - Other: *	Requires host plant, elderberry (<i>Sambucus</i> spp.) for most of its life cycle. Shrubs must have stem diameters at ground level of 1.0 inch or greater and shrubs must be found less than 3,000 feet in elevation. Typically riparian and upland associated.	Unlikely. No suitable habitat (elderberry shrubs) observed in recent and previous site surveys.
Fish			
Steelhead, Central Valley ESU <i>Oncorhynchus mykiss irideus</i>	Fed: FT State: - Other: -	Occurs below man-made impassable barriers in the Sacramento and San Joaquin rivers and tributaries. Adults migrate from ocean to natal freshwater streams to spawn. Yuba River has essentially the only remaining wild steelhead fishery in Central Valley.	Unlikely. Strap Ravine provides marginal quality habitat for species. Known occurrences throughout Dry Creek system.
Central Valley spring-run Chinook salmon <i>Oncorhynchus tshawytscha</i>	Fed: FT State: CT Other: -	ESU covers spring-run salmon in Sacramento River and primarily found in the following tributaries: Butte, Big Chico, Deer, and Mill creeks and the Feather River.	None. No suitable habitat present. Site located outside of species' range.
Delta smelt <i>Hypomesus transpacificus</i>	Fed: FT State: CT Other: -	Endemic to the Sacramento-San Joaquin Delta in coastal and brackish waters. Occurs seasonally in Suisun and San Pablo bays. Spawning usually occurs in dead-end sloughs and shallow channels.	None. No suitable habitat present. Located outside of species' range.

Appendix D
Potentially-Occurring Special-Status Wildlife- Beaver Creek

	Status*	Habitat	Probability on Project Site
Amphibians			
California tiger salamander <i>Ambystoma californiense</i>	Fed: FT State: CT Other: -	Occurs in annual grassland habitat (<1500 feet) and occasionally in grassy understory of valley-foothill hardwood habitats where lowland aquatic sites are available for breeding. Breeds primarily in vernal pools.	None. No suitable habitat present onsite or in surrounding area. No known occurrences in Placer County.
Western spadefoot <i>Spea hammondi</i>	Fed: - State: SSC Other: -	Found primarily in grassland habitats, but may occur in valley and foothill woodlands. Requires vernal pools, seasonal wetlands, or stock ponds for breeding and egg laying. Prefers more turbid pools for predator avoidance.	None. No suitable aquatic breeding habitat observed. Generally known from seasonal wetlands in valley floor to west.
California red-legged frog <i>Rana draytonii</i>	Fed: FT State: SSC Other: -	Occurs in lowlands and foothills in deeper pools and slow-moving streams, usually with emergent wetland vegetation. Requires 11-20 weeks of permanent water for larval development.	None. No suitable habitat present onsite. Only one documented occurrence in Placer County. Site located outside of species' current range. Thought to be extirpated from valley floor.
Reptiles			
Western pond turtle <i>Emys marmorata</i>	Fed: - State: SSC Other: -	Inhabits ponds, marshes, rivers, streams, and irrigation ditches with aquatic vegetation. Needs suitable basking sites and upland habitat for egg laying.	Unlikely. No suitable aquatic habitat observed within study area. Individuals may periodically occur along drainage when moving between suitable habitat located off site.
Giant garter snake <i>Thamnophis gigas</i>	Fed: FT State: CT Other: -	Primarily associated with marshes and sloughs, less with slow-moving creeks, and absent from larger rivers. Nocturnal retreats include mammal burrows and crevices. During the day, basks on emergent vegetation such as cattails and tules.	None. No suitable aquatic habitat present onsite or in the surrounding region. No known occurrences in region.
Birds			
White-tailed kite <i>Elanus leucurus</i>	Fed: - State: CFP Other: -	Found in lower foothills and valley margins with scattered oaks and along river bottomlands or marshes adjacent to oak woodlands. Nests in trees with dense tops.	Unlikely. Prefers nesting in woodlands or individuals trees closer to larger tracts of open foraging habitat.
Bald eagle <i>Haliaeetus leucocephalus</i>	Fed: - State: CE Other: CFP	Occurs along shorelines, lake margins, and rivers. Nests in large, old-growth or dominant trees with open branches.	None. No suitable nesting or foraging habitat present onsite.

Appendix D
Potentially-Occurring Special-Status Wildlife- Beaver Creek

	Status*	Habitat	Probability on Project Site
Swainson's hawk <i>Buteo swainsoni</i>	Fed: - State: CT Other: *	Breeds in open areas with scattered trees; prefers riparian and sparse oak woodland habitats. Requires nearby grasslands, grain fields, or alfalfa for foraging. Rare breeding species in Central Valley.	None. No suitable nesting or foraging habitat present onsite or in the vicinity of the study area. Known mainly from valley floor to the west.
Golden eagle <i>Aquila chrysaetos</i>	Fed: - State: CFP Other: -	Found in rolling foothill grassland with scattered trees. Nests on cliffs and in large trees in open areas.	None. No suitable nesting or foraging habitat present onsite.
California black rail <i>Laterallus jamaicensis coturniculus</i>	Fed: - State: CT Other: CFP	Inhabits salt, fresh, and brackish water marshes with little daily and/or annual water fluctuations. In freshwater habitats, preference is for dense bulrush and cattails. Several scattered populations documented from Butte Co. to southern Nevada Co.	Unlikely. Wetland habitats present onsite do not provide suitable habitat components for species. Wetlands lack persistent water levels preferred by species.
Burrowing owl <i>Athene cucularia</i>	Fed: - State: SSC Other: *	Found in annual and perennial grasslands. Nests in burrows dug by small mammals, primarily ground squirrels.	None. No suitable burrowing habitat present onsite. Prefers open habitats such as grassland, agricultural areas, and open shrubland and woodland.
Purple martin <i>Progne subis</i>	Fed: - State: SSC Other: *	Breeds in riparian woodland, oak woodland, open coniferous forests. Secondary cavity nester. Requires nest sites close to open foraging areas of water or land.	Unlikely. Onsite woodlands provide marginal quality habitat for the species. Prefers large trees with cavities on hillsides or ridgetops with view of open foraging areas.
Bank swallow <i>Riparia riparia</i>	Fed: - State: CT Other: *	Colonial nester near riparian and other lowland habitats. Requires vertical banks or cliffs with fine-textured, sandy soils near streams, rivers, and lakes.	None. No suitable nesting habitat present onsite.
Grasshopper sparrow <i>Ammodramus savannarum</i>	Fed: - State: SSC Other: -	Breeds in grasslands and savannahs in rolling hills and lower mountain hillsides up to 5000 feet elevation.	None. No suitable nesting habitat. Prefers expansive areas of grassland for nesting.
Tricolored blackbird <i>Agelaius tricolor</i>	Fed: - State: SSC Other: -	Colonial nester in dense cattails, tules, brambles or other dense vegetation. Requires open water, dense vegetation, and open grassy areas for foraging.	Unlikely. Marginal quality habitat present onsite. Site lacks open water areas for foraging. Very low potential to occur onsite.

Appendix D

Potentially-Occurring Special-Status Wildlife- Beaver Creek

	Status*	Habitat	Probability on Project Site
Mammals			
Pallid bat <i>Antrozous pallidus</i>	Fed: - State: SSC Other: *	Occurs in grasslands, woodlands, deserts & urban habitats; open habitat required for foraging. Common in dry habitats with rocky outcrops, cliffs, and crevices for roosting. Roosts include caves, mines, bridges & occasionally hollow trees, buildings.	None. No suitable roosting habitat observed onsite.
American badger <i>Taxidea taxus</i>	Fed: - State: CSC Other: -	Occurs in dry, open soils in herbaceous, shrub, and forest habitats. Needs friable, uncultivated soil. Preys on rodents.	None. No suitable habitat. No evidence of species occurrence observed.
*Status	Federal: FE - Federal Endangered FT - Federal Threatened FPE - Federal Proposed Endangered FPT - Federal Proposed Threatened FC - Federal Candidate FPD - Federal Proposed for Delisting	State: CE - California Endangered CT - California Threatened CR - California Rare CC - California Candidate CFP - California Fully Protected CSC - California Species of Special Concern	Other: Some species have protection under the other designations, such as the California Department of Forestry Sensitive Species, Bureau of Land Management Sensitive Species, U.S.D.A. Forest Service Sensitive Species, and the Migratory Bird Treaty Act. Raptors and their nests are protected by provisions of the California Fish and Game Code. Certain areas, such as wintering areas of the monarch butterfly, may be protected by policies of the California Department of Fish and Game. WL - CDFG Watch List

Biological Resources Assessment for the ±33-ACRE CREEKSIDE OAKS STUDY AREA

INTRODUCTION

Project Location

Salix Consulting, Inc (Salix) has prepared a Biological Resources Assessment Update for the ±33-acre Creekside Oaks Study Area (study area) located in the community of Granite Bay, Placer County, California. The study area is located just west of Quartzite Circle, between Douglas Boulevard and Eureka Road, in the western portion of Granite Bay. It is situated in Section 9, Township 10 North and Range 7 East on the Folsom, California 7.5-minute USGS topographic quadrangle (Figure 1). The approximate coordinates for the center of the property are 38°44' 31" N and 121°12' 40" W.

Project Setting

The site occurs at the lower edge of the western foothills of the Sierra Nevada at elevation ranging between 255 and 295 feet. The study area supports mostly foothill woodland and topography is highly variable due to the presence of historic dredge tailings throughout the site. Strap Ravine, a regionally intermittent stream, runs in a westerly direction through the northern portion of the site. The study area is surrounded by rural residential on three sides and Douglas Boulevard and higher density development to the north (Figure 2).

Project Background

In 2006 and 2007 North Fork Associates conducted a wetland delineation and prepared the *Biological Resources Assessment for the ±33-acre Creekside Oaks Project Site, Granite Bay, California* (NFA 2006, NFA 2007). Salix Consulting, Inc recently conducted an additional field assessment. This report updates the 2007 BRA, provides current information on biological resources of the study area, and incorporates information from previous reports where appropriate.

Objectives of Biological Resources Assessment

- Identify and describe the biological communities present in the study area
- Record plant and animal species observed in the study area
- Evaluate and identify sensitive resources and special-status plant and animal species that could be affected by project activities
- Provide conclusions and recommendations

METHODS

Literature Review

As part of this assessment, Salix biologists reviewed aerial photographs, USGS maps and site maps for the study area. Standard publications were reviewed to provide information on life history, habitat requirements and distribution, of regionally occurring animal species. They include published books, peer-reviewed articles, field guides, and the California Wildlife Habitats Relationships Program. Chapter 5 of the Granite Bay Community Plan (Placer County 2012) was also reviewed as part of this assessment for additional information of natural resources of the study area and surrounding region. Publications utilized in this assessment are included in the References section of this document.

The Wetland Delineation (NFA 2006) and Biological Resources Assessment (NFA 2007) previously prepared for the Creekside Oaks Project Site were reviewed as part of this study and information was incorporated into this BRA where appropriate. Most recent studies on the known ranges and preferred habitats of special-status species known from the region were reviewed and the potential for occurrence of identified species within the study area was updated based on this information.

Special-Status Species Reports

To determine which special-status species could occur within or near the study area, Salix biologists queried the California Natural Diversity Data Base (CDFW 2014) and the California Native Plant Society Inventory (CNPS 2014) for reported occurrences of special-status fish, wildlife, and plant species in the region surrounding the study area. The nine-quadrangle search area included the Folsom, Roseville, Rocklin, Pilot Hill, Citrus Heights, Clarksville, Carmichael, Buffalo Creek, and Folsom Southeast USGS quadrangles. Salix biologists also reviewed the following special-status species lists for the project vicinity:

- U.S. Fish and Wildlife Service (USFWS) list of Federal Endangered and Threatened Species for the Folsom USGS quadrangle
- USFWS list of Federal Endangered and Threatened Species for Placer County and
- California Department of Fish and Wildlife list of Species of Special Concern

For the purposes of this report, special-status species are those that fall into one or more of the following categories:

- Listed as endangered or threatened under the federal Endangered Species Act (or candidate species or formally proposed for listing),
- Listed as endangered or threatened under the California Endangered Species Act (or proposed for listing),
- Designated as rare, protected, or fully protected pursuant to California Fish and Game Code,

- Designated a Species of Special Concern by the California Department of Fish and Wildlife, or
- Designated as Ranks 1 or 2 on lists maintained by the California Native Plant Society

Field Assessments

A field assessment of the study area was conducted by Salix biologists, Jeff Glazner (plants and wetlands) and Gaylene Tupen (wildlife) in May and August, 2014 to provide information on sensitive plant and wildlife resources present on site. During the field assessment, plants and animals observed on site were listed, habitat types were determined, and the potential for the site to support special-status species known from the region was assessed. Appendix A is a list of plants observed, and Appendix B is a list of wildlife observed onsite. Plant names are according to *The Jepson Manual Vascular Plants of California, Second Edition* (Baldwin et al 2012). Standard manuals were used to identify wildlife species observed.

SURVEY AND LITERATURE SEARCH RESULTS

Biological Communities

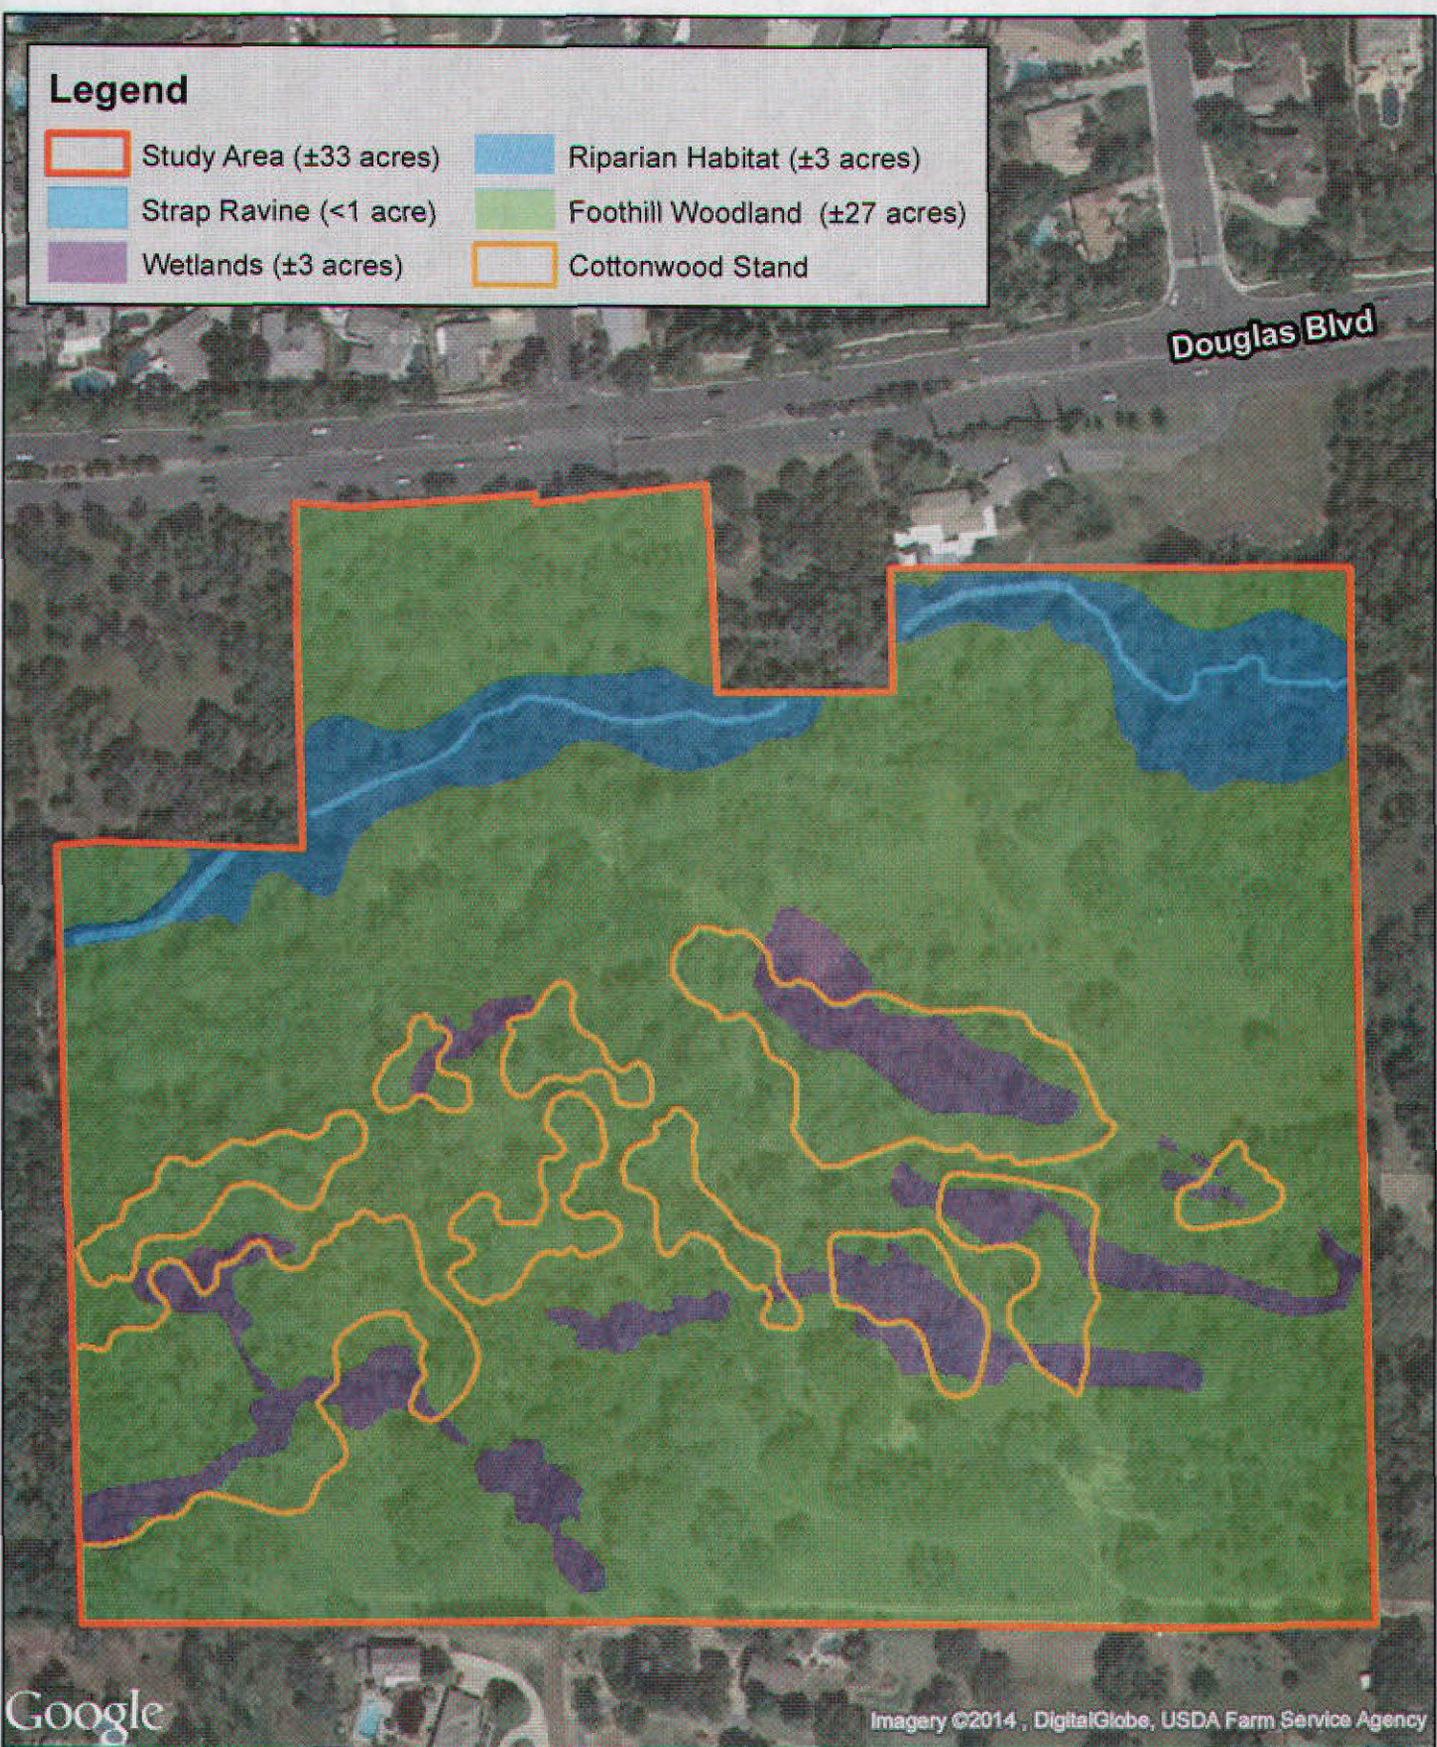

Biological communities and sensitive habitats of the study area were mapped and are summarized in Table 1 and illustrated in Figure 3. Representative site photographs of the study area are presented in Figure 4. Areas designated as "waters of the U.S." throughout the Study Area, including streams and wetlands, are discussed below under **Waters of the U.S.** Appendix A lists the plant species that were observed during field surveys.

Table 1 Biological Communities/Habitat Types within the Creekside Oaks Study Area

HABITAT MAP

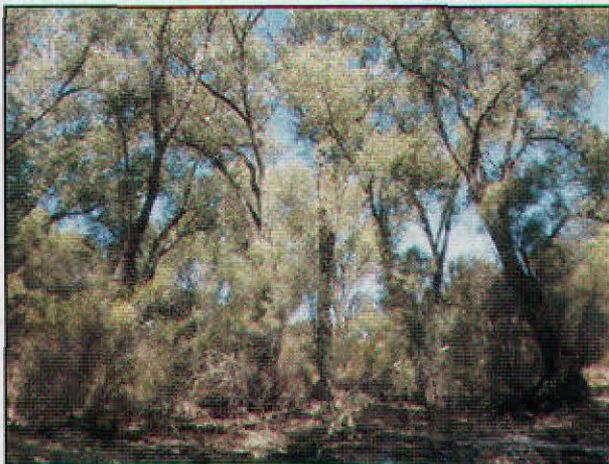

Creekside Oaks
Granite Bay, Placer County, CA

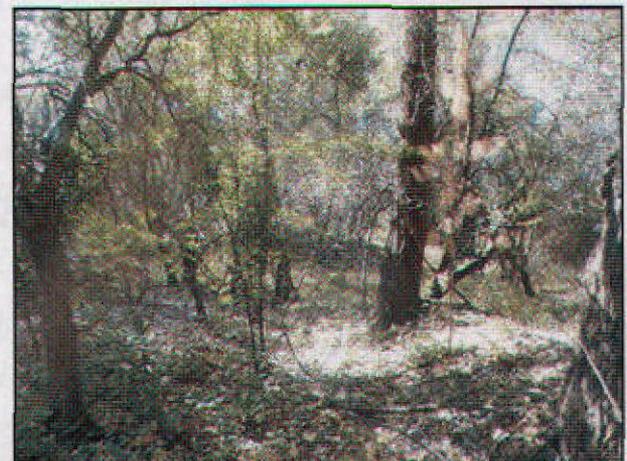

Strap Ravine in north central area of site flowing approximately 1 cfs in early June 2014.

Seasonal Wetland (SW3) near center of site.

Cottonwood gallery associated with seasonal wetlands.

Dense vegetation in wooded area.

Foothill Woodland

Foothill Woodland is the primary habitat type within the Creekside Oaks study area, occupying approximately 27 acres. Tree cover is variable throughout the site, ranging from dense to sparse. The majority of the acreage has high canopy cover. An area along the southern boundary and an area in the western middle of the site are the open canopied areas. The most abundant trees within foothill woodland include interior live oak (*Quercus wislizenii*), blue oak (*Quercus douglasii*), and gray pine (*Pinus sabiniana*).

Understory shrubs include poison oak (*Toxicodendron diversilobum*), coyote brush (*Baccharis pilularis*), buckbrush (*Ceanothus cuneatus*), California coffeeberry (*Frangula californica*), buckeye (*Aesculus californica*), toyon (*Heteromoles arbutifolia*), hoary coffeeberry (*Frangula californica*), Himalayan blackberry (*Rubus armeniacus*), and California blackberry (*Rubus ursinus*). Common herbaceous species within the understory include field hedge parsley (*Torilis arvensis*), Italian thistle (*Carduus pycnocephalus*), yellow star thistle (*Centaurea solstitialis*), skeleton weed (*Chondrilla juncea*), bindweed (*Convolvulus arvensis*), broad-leaf filaree (*Erodium botrys*), soft chess (*Bromus hordeaceus*), hedgehog dogtail (*Cynosurus echinatus*), soap plant (*Chlorogalum pommeridianum*), turkey mullein (*Croton setigerus*), Klamathweed (*Hypericum perforatum*), rose clover (*Trifolium hirtum*), spanish clover (*Acmispon americanus*), vetch (*Vicia* spp.), wild oat (*Avena fatua*), and ripgut grass (*Bromus diandrus*).

Approximately six (6) acres of mature Fremont cottonwood (*Populus fremontii*) stands occur in the southern half of the site as part of the foothill woodland. These areas correspond to historic placer mining and disrupted local hydrology.

A few willows including a red willow (*Salix laevigata*) occur within the study area, often in association with the cottonwoods. These willows are generally restricted to lower-elevation areas scattered throughout the dredge tailings and occur as part of the foothill woodland community.

Riparian Woodland

Within the study area, approximately three acres of riparian woodland occurs in a fairly consistent width along the Strap Ravine channel. Canopy species include Fremont cottonwoods, Gooding's willow (*Salix goodingii*), red willow (*Salix laevigata*), sandbar willow (*Salix exigua*) and valley oak. Himalayan blackberry is the most common understory species and occurs in dense thickets along many reaches.

Waters of the U S

Waters of the U S were mapped in 2005-2006 as shown on Figure 3. Wetlands are primarily associated with the placer-mined areas in the southern half of the site.

Wetlands occupy approximately three acres of the project site. Common species include broad-leaved cattail (*Typha latifolia*), spikerush (*Eleocharis pachycarpa*), Mexican rush (*Juncus mexicanus*), iris-leaf rush (*Juncus xiphioides*), clustered field sedge (*Carex praegracilis*), and cocklebur (*Xanthium strumarium*). The overstory commonly includes

mature cottonwoods and other typical foothill woodland species. Wetland swales throughout the site contained minimal to no surface water at the time of the May 2014 field assessment.

Strap Ravine is a seasonal (intermittent) stream. The reach of Strap Ravine that runs through the study area is characterized as a relatively shallow channel, is 5 to 15 feet wide and is bounded on both sides by blackberry, willow, cottonwood and oaks. Streamflow within Strap Ravine at the time of the May 2014 field assessment was a trickle.

Wildlife Occurrence and Use

The study area supports a wide diversity of wildlife due to the abundance of trees that provide roosting and nesting sites, escape and thermal cover, and a variety of food sources. In addition, Strap Ravine provides a source of water for wildlife of the area and may be used as a movement corridor between habitats located on and offsite. A large number of snags are located throughout the site and provide nesting cavities for birds such as woodpeckers, bluebirds, nuthatches, American kestrel, and western screech owl. Taller trees of the site, including mature cottonwoods, gray pines, and oaks, provide suitable nesting habitat for raptors such as great horned owl, red-shouldered hawk, and Cooper's hawk.

The following animals were observed in association with foothill woodland of the study area during the May 2014 field assessment: acorn woodpecker (*Melanerpes formicivorus*), black phoebe (*Sayornis nigricans*), California quail (*Callipepla californica*), northern flicker (*Colaptes auratus*), white-breasted nuthatch (*Sitta carolinensis*), wild turkey (*Meleagris gallopavo*), Nuttall's woodpecker (*Picoides nuttalli*), oak titmouse (*Baeolophus inornatus*), orange-crowned warbler (*Vermivora celata*), spotted towhee (*Pipilo maculatus*), ash-throated flycatcher (*Myiarchus cinerascens*), and California towhee (*Pipilo crissalis*). Red-shouldered hawks (*Buteo lineatus*) were vocalizing within and near the site during the field assessment; however, no active nesting activity was observed.

The Granite Bay Community Plan indicates that Strap Ravine is not likely to support anadromous salmonids, including Chinook salmon (*Oncorhynchus tshawytscha*) and steelhead (*Oncorhynchus mykiss irideus*) (Placer County 2012). Anadromous salmonids may be absent from Strap Ravine, including the reach that runs through the study area, due to low instream flows and previous channel disturbance. Nearby tributaries within the Dry Creek system that are known to support salmon and steelhead include Miner's Ravine and Linda Creek (Placer County 2012; Placer County 2004). When flow is sufficient, portions of Strap Ravine may support resident trout and warm-water fish species.

Although salmon are not expected to occur within Strap Ravine, the study area occurs within Hydrologic Unit 18020111, which is mapped as Essential Fish Habitat (EFH) for Chinook salmon (*Oncorhynchus tshawytscha*) (NOAA 2008). Under the Magnuson-Stevens Fishery Conservation and Management Act (MSA), Pacific Coast salmon EFH includes all water bodies occupied or historically accessible in Washington, Oregon, Idaho and California that occur within selected USGS Hydrologic Units identified by the

National Marine Fisheries Service (NOAA 2008). The MSA requires consultation with the National Marine Fisheries Service (NMFS) for projects that include a federal action or federal funding and may adversely modify EFH. If activities implemented within the study area will result in disturbance of Secret Ravine (mapped EFH) and require a permit from a federal agency (i.e., the Corps), consultation with NMFS may be required.

Special-Status Species

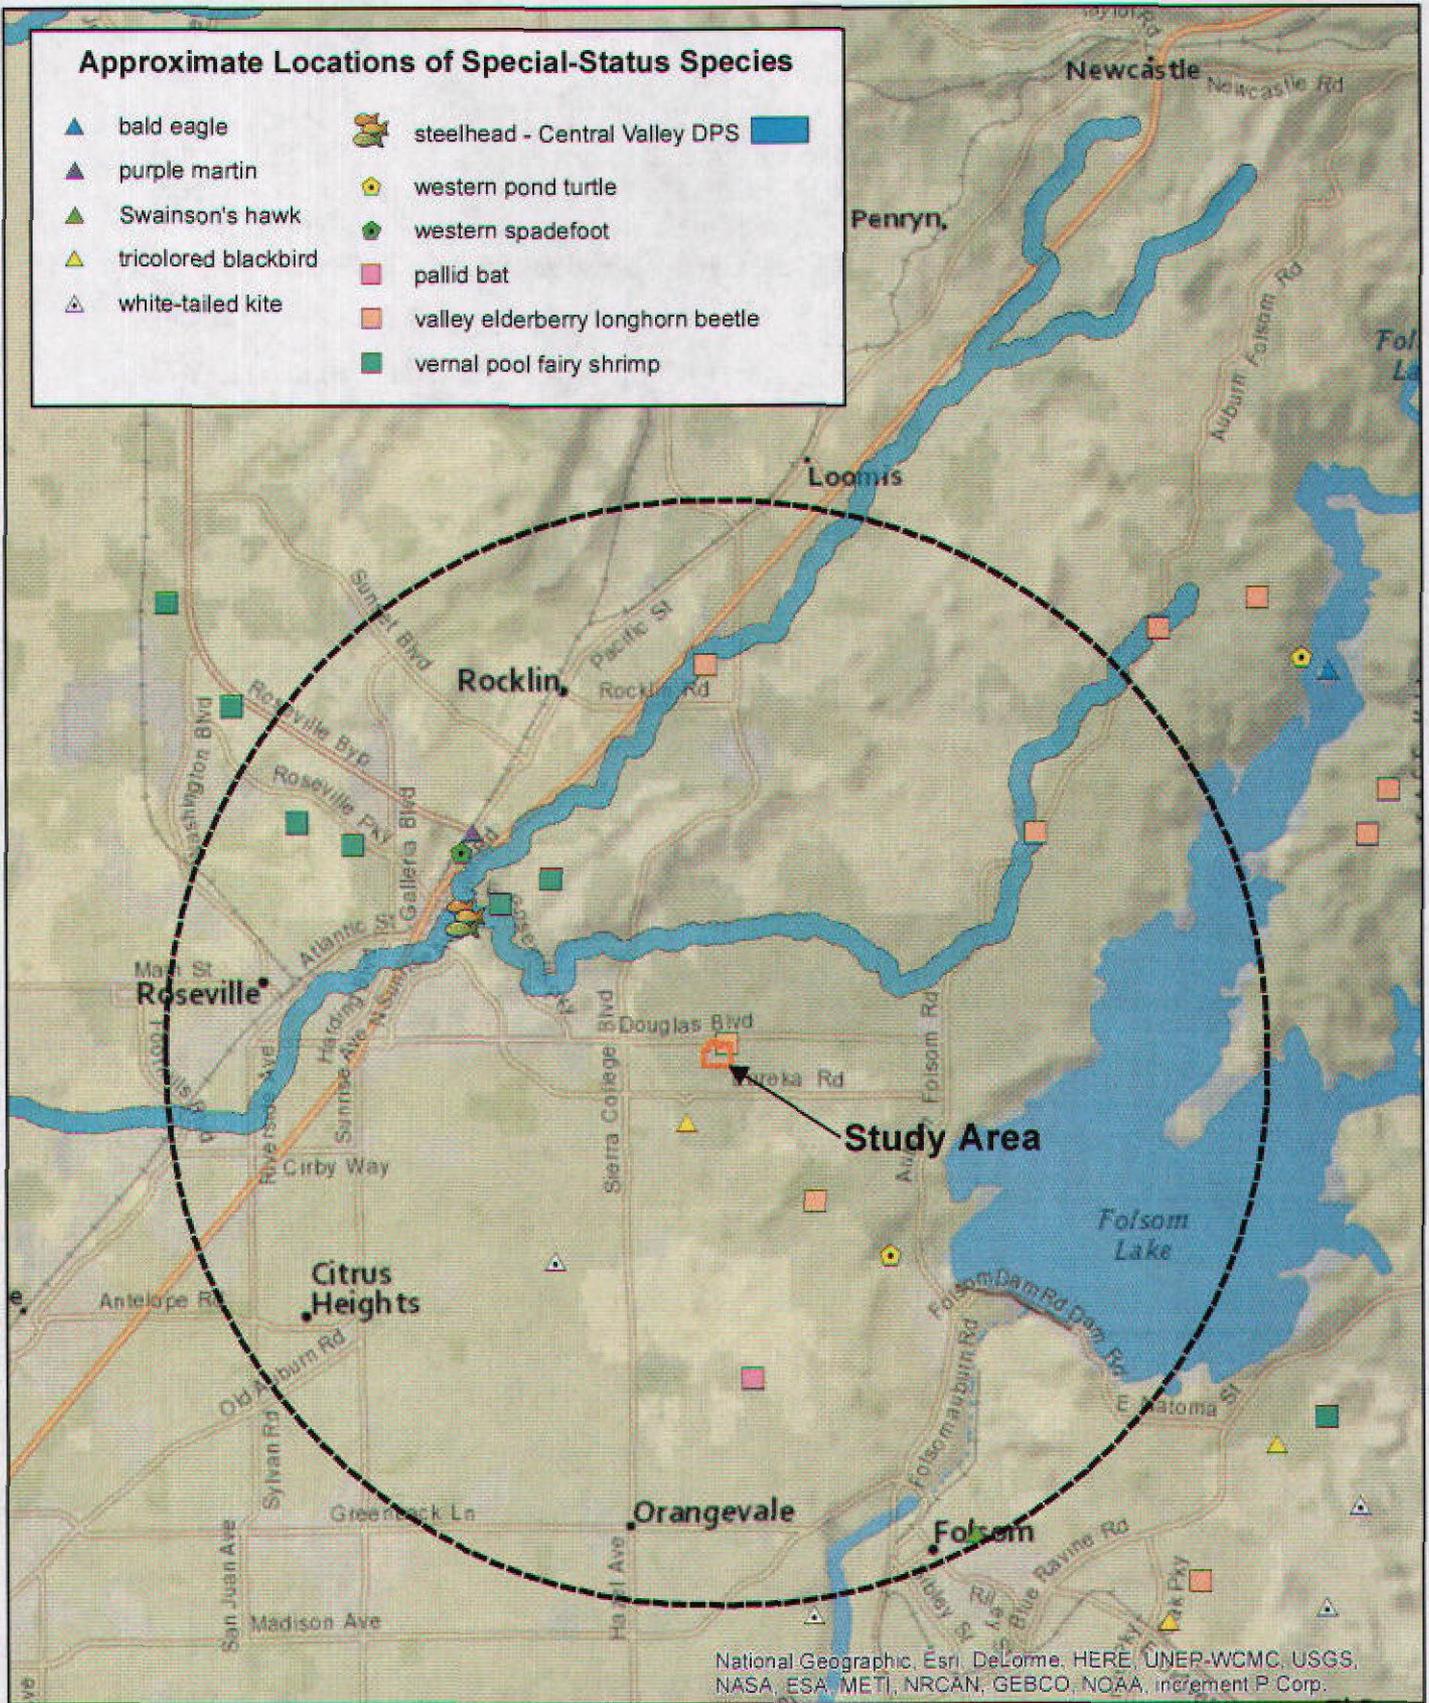

To determine potentially-occurring special-status species, the standard databases from the USFWS, CDFW (the CNDDDB), and CNPS were queried and reviewed. These searches provided a comprehensive list of regionally occurring species and were used to determine which species have some potential to occur within or near the study area. Appendix C lists potentially-occurring special-status plants, and Appendix D lists special-status animals compiled from our queries as described above. The field survey and the best professional judgment of Salix biologists were used to further refine the tables in Appendices C and D. Additionally, plant species found on the CNPS List 3 and 4 are not considered further in the document. Figures 5 and 6 show approximate locations of reported occurrences of CNDDDB special-status wildlife and plants, respectively, within a five-mile radius of the study area.

Of the 24 animal species in Appendix D, 11 were identified as occurring within or near the 5-mile radius of the study area (Figure 5). Five of the animal species occurring within the 5-mile radius, as well 12 of the remaining species in Appendix D, were determined to have no potential for occurring onsite due to the absence of suitable aquatic habitats including perennial streams, ponds, vernal pools, or marshes. These are summarized in Table 2 below.

Of the 19 potentially-occurring plant species in Appendix C, eight were identified as occurring within or near a 5-mile radius of the study area (Figure 6). Six of the species occurring within the 5-mile radius, as well as the remainder of the potentially-occurring plant species (11 species) that do not occur within the 5-mile radius, were determined have no potential for occurring onsite due to the absence of suitable habitat or substrates. These are summarized in Table 2 below.

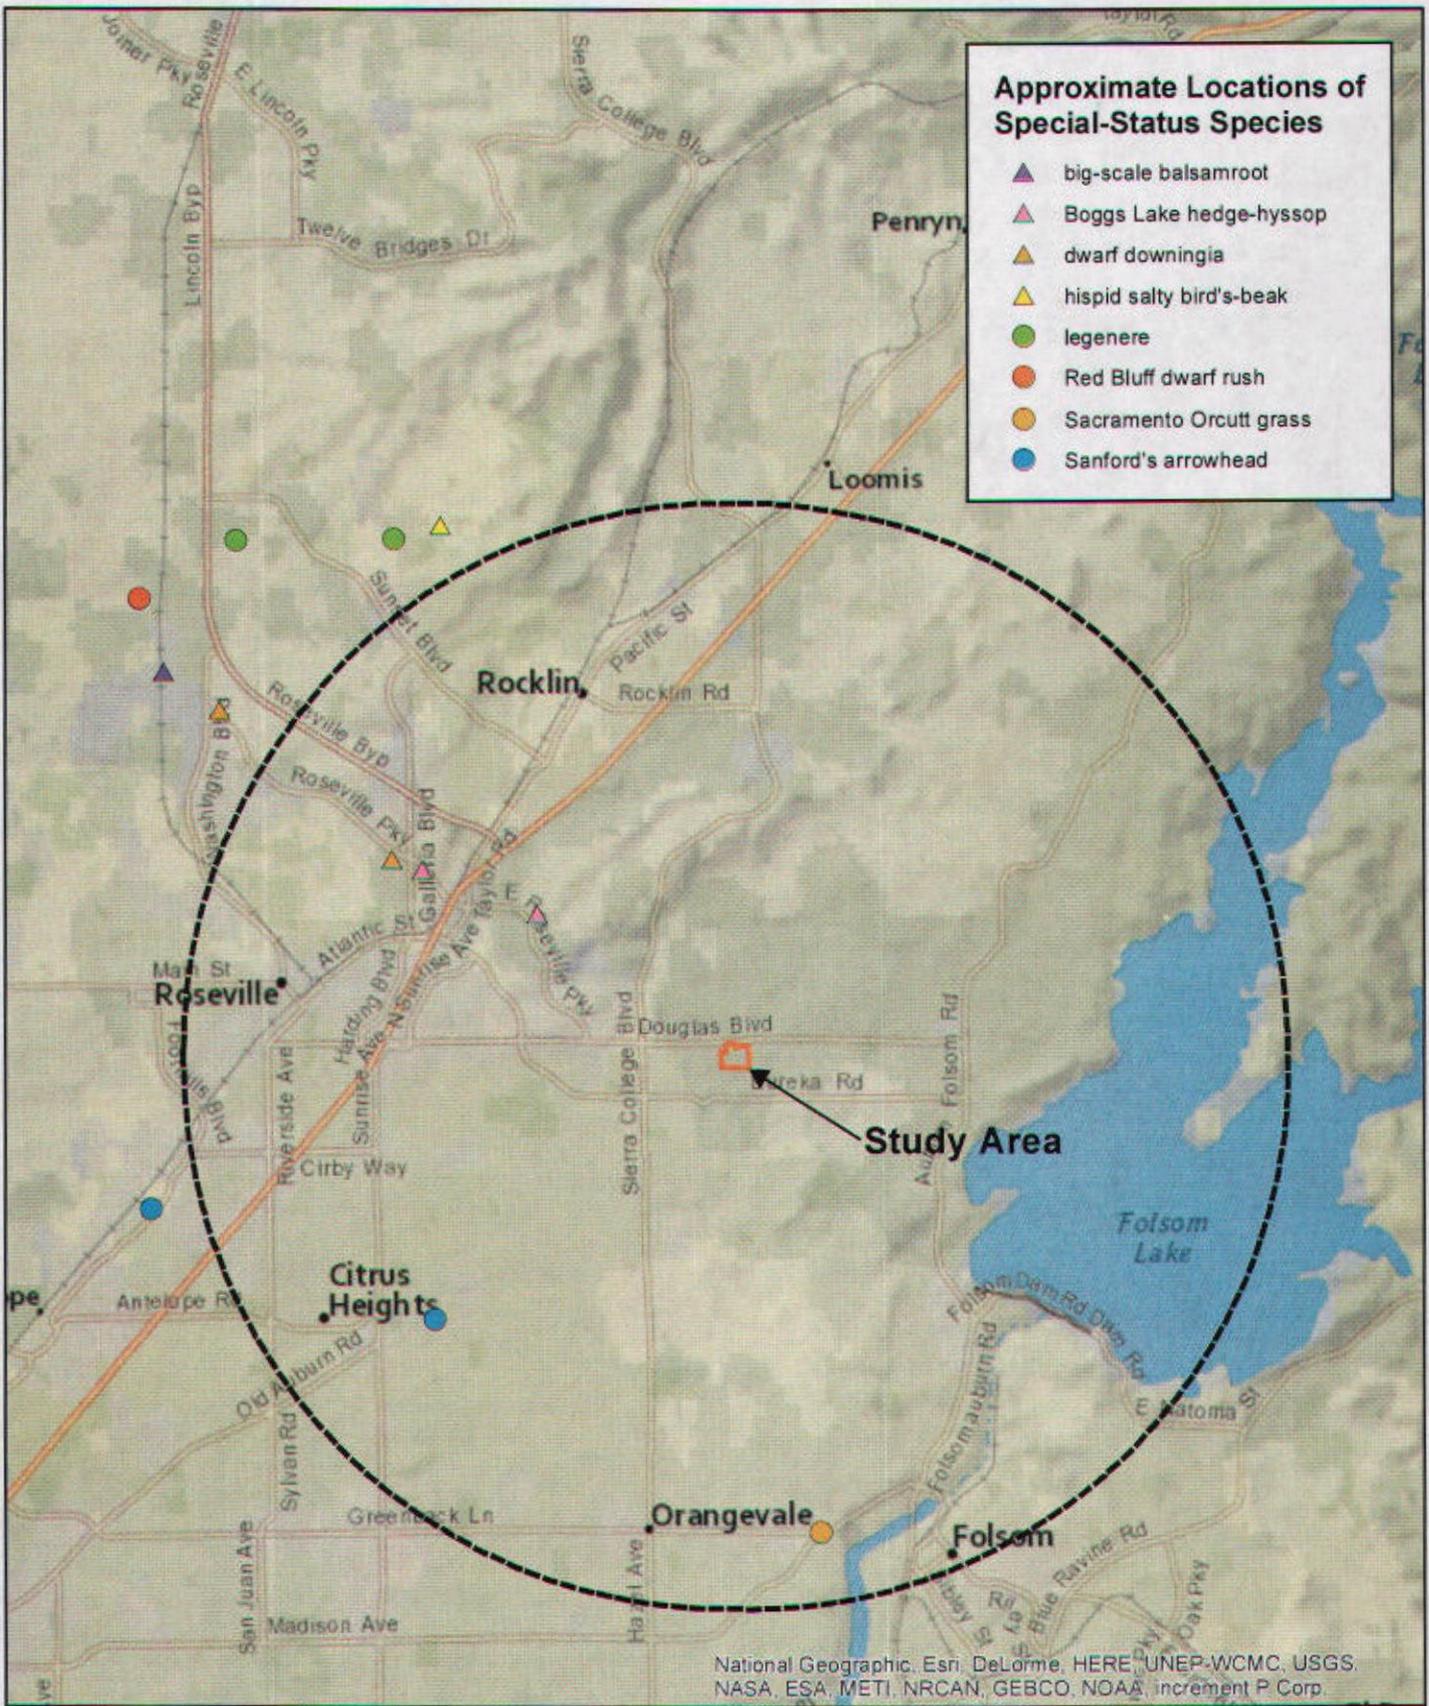

Approximate Locations of Special-Status Species

Table 2 below provides a summary of the 17 plant species and 17 animal species determined to have no potential for occurring onsite.

Species	Status*			Habitat	Reason for NO POTENTIAL to occur
	Federal	State	CNPS		
Plants					
Red Hills soaproot <i>Chlorogalum grandiflorum</i>	FSW	-	1B.2	Chaparral; cismontane woodland[serpentinite or gabbroic];	Site lacks gabbro/serpentine soils.
Boggs Lake hedge-hyssop <i>Gratiola heterosepala</i>	-	CE	1B.2	Marshes and swamps. Shallow water habitats and margins of vernal pools.	No suitable habitat present onsite.
Sacramento Orcutt grass <i>Orcuttia viscida</i>	FE	CE	1B.1	Vernal pools in valley grasslands of the Central Valley.	No suitable habitat present onsite.
Tuolumne button-celery <i>Eryngium pinnatisectum</i>	-	-	1B.2	Cismontane woodland; lower montane coniferous forest; vernal pools; [mesic].	Site lacks suitable habitat.
Layne's ragwort <i>Packera layneae</i>	FT	CR	1B.2	Chaparral; cismontane woodland [serpentinite or gabbroic].	Site lacks gabbro/serpentine soils.
El Dorado County mules ears <i>Wyethia reticulata</i>	FE	CR	1B.2	Chaparral; cismontane woodland; [gabbroic or serpentinite].	Site lacks gabbro/serpentine soils.
Dwarf downingia <i>Downingia pusilla</i>	-	-	2B.2	Valley and foothill grassland (mesic); vernal pools.	Site lacks suitable habitat.
Legenere <i>Legenere limosa</i>	-	-	1B.1	Vernal pools and similar wetlands.	Site lacks suitable habitat.
Stebbins' morning-glory <i>Calystegia stebbinsii</i>	FE	CE	1B.1	Chaparral (openings); cismontane woodland; [serpentinite or gabbroic].	Site lacks gabbro/serpentine soils.
Ahart's dwarf rush <i>Juncus leiospermus ahartii</i>	-	-	1B.2	Vernal pools.	Site lacks suitable habitat.
Red Bluff dwarf rush <i>Juncus leiospermus leiospermus</i>	-	-	1B.1	Chaparral; cismontane woodland; valley and foothill grassland; vernal pools; [vernally mesic].	Site lacks suitable habitat.
Pine Hill flannelbush <i>Fremontodendron decumbens</i>	FE	CR	1B.2	Chaparral; cismontane woodland; [gabbroic or serpentinite].	Site lacks gabbro/serpentine soils.
Hispid salty bird's-beak <i>Chloropyron molle hispidum</i>	-	-	1B.1	Meadows; playas; [alkaline].	Site lacks saline soils.
Bogg's Lake hedge-hyssop <i>Gratiola heterosepala</i>	-	CE	1B.2	Marshes and swamps (lake margins); vernal pools. Below 1200 m.	Site lacks suitable habitat.

**Table 2
Special Status Species Determined to have NO POTENTIAL to Occur Within the
Creekside Oaks Study Area**

Species	Status*			Habitat	Reason for NO POTENTIAL to occur
	Federal	State	CNPS		
Slender Orcutt grass <i>Orcuttia tenuis</i>	FT	CE	1B 1	Vernal pools	Site lacks suitable habitat.
Invertebrates					
Vernal pool fairy shrimp <i>Branchinecta lynchi</i>	FT	-	-	Vernal pools and seasonal wetlands	No suitable aquatic habitat (vernal pools) present onsite
Vernal pool tadpole shrimp <i>Lepidurus packardii</i>	FE			Vernal pools with clear to highly turbid water	No suitable habitat (vernal pools) present onsite
Conservancy fairy shrimp <i>Brachunecta conservatio</i>	FE			larger turbid cool water vernal pools located in alluvial swales	No suitable habitat (vernal pools) present onsite
Fish					
Central Valley spring-run Chinook salmon <i>Oncorhynchus tshawytscha</i>	FT	CT		Spring run in Sacramento River. Primarily found in Butte, Big Chico, Deer, and Mill creeks and the Feather River tributaries.	No suitable habitat present. Site located outside of species' range.
Delta smelt <i>Hypomesus transpacificus</i>	FT	CT		Endemic to the Sacramento-San Joaquin Delta in coastal and brackish waters.	No suitable habitat present. Located outside of species' range.
Amphibians					
California tiger salamander <i>Ambystoma californiense</i>	FT	CT		Annual grassland habitat (<1500 feet) and occasionally in grassy understory of valley-foothill hardwood habitats where lowland aquatic sites are available for breeding. Breeds primarily in vernal pools.	No suitable habitat present onsite or in surrounding area. No known occurrences in Placer County.
California red-legged frog <i>Rana draytoni</i>	FT	SSC		Ponds and deeper pools along streams with emergent or overhanging vegetation. Surface water to at least June.	No suitable habitat present onsite. Only one documented occurrence in Placer County.

**Table 2
Special Status Species Determined to have NO POTENTIAL to Occur Within the
Creekside Oaks Study Area**

Species	Status*			Habitat	Reason for NO POTENTIAL to occur
	Federal	State	CNPS		
Western spadefoot <i>Spea hammondi</i>		SSC		Requires vernal pools seasonal wetlands, or stock ponds for breeding in grassland, sandy washes or open woodlands	None No suitable aquatic breeding habitat observed. Generally known from seasonal wetlands in valley floor to west
Reptiles					
Giant garter snake <i>Thamnophis gigas</i>	FT	CT		Primarily associated with marshes and sloughs, less with slow- moving creeks and absent from larger rivers	No suitable aquatic habitat present onsite or in the surrounding region No known occurrences in region
Birds					
Bald eagle <i>Haliaeetus leucocephalus</i>		CE CFP		Occurs along shorelines lake margins and rivers. Nests in large old growth or dominant trees with open branches	No suitable nesting or foraging habitat present onsite
Swainson s hawk (nesting) <i>Buteo swainsoni</i>		CT		Riparian woodlands and oak savannah with adjacent grassland or agricultural fields generally in the Central Valley	No suitable nesting or foraging habitat onsite or in vicinity Site located outside of typical range of species
Golden eagle <i>Aquila chrysaetos</i>		CFP		Found in rolling foothill grassland with scattered trees Nests on cliffs and in large trees in open areas	No suitable nesting habitat present onsite
Burrowing owl <i>Athene cunicularia</i>		SSC		Found in annual and perennial grasslands Nests in burrows dug by small mammals, primarily ground squirrels	No suitable burrowing habitat present onsite Prefers open habitats such as grassland, agricultural areas and open shrubland and woodland
Bank swallow <i>Riparia riparia</i>		CT		Colonial nester near riparian and oher lowland habitats Requires vertical banks or cliffs with fine-textured, sandy soils near streams, rivers and lakes	No suitable nesting habitat present onsite

**Table 2
Special Status Species Determined to have NO POTENTIAL to Occur Within the
Creekside Oaks Study Area**

Species	Status*			Habitat	Reason for NO POTENTIAL to occur
	Federal	State	CNPS		
Grasshopper sparrow <i>Ammodramus savannarum</i>		SSC		Breeds in grasslands and savannahs in rolling hills and lower mountain hillsides up to 5000 feet elevation	No suitable nesting habitat Prefers expansive areas of grassland for nesting
Mammals					
Pallid bat <i>Antrozous pallidus</i>	-	SSC		Open dry areas with rocky outcrops for roosting	No suitable roosting habitat present on site No structures or significant rock features to support roosting of species
American badger <i>Taxidea taxus</i>		SSC		Occurs in dry open soils in herbaceous, shrub and forest habitats Needs friable uncultivated soil. Preys on rodents	No suitable habitat No evidence of species occurrence observed

Table 3 below provides a summary of those species that have been determined to have some potential to occur within the study area based on the analysis of potential to occur presented in Appendices C and D Discussions for the identified species are provided following Table 3

**Table 3
Special Status Species Determined to Have Some Potential to Occur Within
Creekside Oaks Study Area**

Species	Status*			Habitat	Potential for Occurrence Within Study Area**
	Federal	State	CNPS		
Plants					
Big-scale balsamroot <i>Balsamorhiza macrolepis</i> <i>var macrolepis</i>		-	1B 2	Valley grassland and foothill woodland Often on serpentine	Unlikely Marginal habitat occurs onsite
Sanford's arrowhead <i>Sagittaria sanfordii</i>		-	1B.2	Marshes and slow moving water	Unlikely Marginal habitat only in areas that sustain shallow water well into the dry season
Invertebrates					
Valley elderberry longhorn beetle <i>Desmocerus californicus dimorphus</i>	FT	-	-	Elderberry shrubs	Unlikely No elderberry shrubs observed onsite in 2014 (see comments below in text)
Fish					
Steelhead - Central Valley DPS <i>Oncorhynchus mykiss irideus</i>	FT			Sacramento River and tributaries including portions of Dry Creek system (Secret Ravine and Miner's Ravine)	Unlikely Strap Ravine provides marginal quality habitat for species Known occurrences throughout Dry Creek system.
Reptiles					
Western pond turtle <i>Emys marmorata</i>		SSC		Permanent aquatic habitats with suitable basking sites and adjacent upland habitat.	Unlikely No suitable aquatic habitat present within the study area May use portions of Strap Ravine as a movement corridor between suitable habitats located off - site
Birds					
Tricolored blackbird (nesting colonies) <i>Agelaius tricolor</i>		SSC	-	Requires open accessible water through nesting - season, a protected nesting substrate, and nearby foraging areas Nests in cattails, tules or blackberry thickets	Unlikely Marginal quality nesting habitat available on site Limited amount of open foraging habitat available

**Table 3
Special Status Species Determined to Have Some Potential to Occur Within
Creekside Oaks Study Area**

Species	Status*			Habitat	Potential for Occurrence Within Study Area**
	Federal	State	CNPS		
White-tailed kite (nesting) <i>Elanus leucurus</i>	-	CFP		Open grassland, meadows and farmlands. Nests in tall trees near foraging areas.	Unlikely. Prefers nesting closer to larger tracts of open foraging habitat.
California black rail <i>Lateralus jamaicensis coturniculus</i>		CT CFP	-	In the Sierra Nevada foothills occurs in freshwater emergent wetlands with shallow persistent water	Unlikely. Marginal quality habitat present onsite. Wetlands lack persistent shallow water preferred by the species.
Purple martin (nesting) <i>Progne subis</i>		SSC	-	Summer visitor of woodlands and low elevation coniferous forests	Possible. Numerous snags and cavities in mature trees throughout site provide suitable nesting habitat.

****Definitions for the Potential to Occur**

Unlikely Minimal or marginal quality habitat in the study area

Possible Suitable habitat occurs within the study area.

Likely Study area provides desirable habitat for species and there is a very high probability for its occurrence

Observed Species was observed within the study area.

Plants

Several special-status plants are known from the surrounding project region and are shown in Figure 5. All but two of the species require habitats that do not occur within the study area and therefore were eliminated from further consideration. As summarized above, the following species shown in Figure 5 occur in either vernal pool or saline marsh habitats in the Central Valley generally to the west of the study area: Boggs Lake hedge-hyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), hispid bird's-beak (*Chloropyron molle ssp. hispidum*), legene (*Legene limosa*), Red Bluff dwarf rush (*Juncus leiospermus var. leiospermus*), and Sacramento Orcutt grass (*Orcuttia*

viscida) Based on the absence of suitable habitat, these species were determined to have no potential for occurring on site

The project site contains marginal habitat for two special-status plant species, both are discussed below

Big-scale balsamroot (*Balsamorhiza macrolepis* var *macrolepis*) was ranked as “unlikely” to occur due to the presence of only marginal quality habitat onsite. Big-scale balsamroot is a herbaceous perennial member of the sunflower family (Asteraceae). It has no state or federal status, but has a California Rare Plant Rank of 1B 2. This species has large yellow flowering heads and leaves that arise from the ground. It differs, in part, from other balsam-roots by having coarsely serrate leaves. Big-scale balsam-root grows in open woodlands and grasslands at widely scattered locations in Northern California. It blooms from March to June.

No members of the genus *Balsamorhiza* or similar genus *Wyethia*, were observed during the May 2014 field assessment. The nearest recorded occurrence of big-scale balsam-root is from approximately 6 to 7 miles northwest of the site just west of Highway 65, between Roseville and Lincoln. Because only marginal quality habitat is present onsite and occurrence of the species is rare in the region, it is unlikely that big-scale balsam root occurs within the study area.

Sanford’s arrowhead (*Sagittaria sanfordii*) is an herbaceous perennial member of the water-plantain family (Alismataceae). It has no state or federal status, but has a CNPS Rare Plant Rank of 1B 2. Preferred habitat includes marshes associated with slow-moving water in sloughs and ditches. It is also known to occur in concrete lined channels with only a few inches of soil. It has a long blooming period, starting as early as May and occasionally lasting until August.

No individuals of this species were observed during the May 2014 field assessment. The closest recorded occurrence of this species is from approximately 3 to 4 miles to the southwest in the Citrus Heights area (CNDDDB 2014). This species was documented at this location in 1997 in a cattail-dominated freshwater marsh. No individuals of the genus *Sagittaria* were observed onsite during the May 2014 field assessment. Because only marginal habitat is present in areas that sustain shallow water well into the dry season, it is unlikely that Sanford’s arrowhead occurs within the study area.

Wildlife

Of the 24 special-status animals identified through the database searches and other literature as occurring within the broader region surrounding the study area, only one was determined to have a reasonable potential for occurring on site, and several were ranked as “unlikely to occur” (Table 3). Many species were determined to have no potential for occurring within the study area due to the absence of suitable habitat or due to the site being located outside of the current range of a species (Table 2). In particular, the site lacks vernal pools, which support the Federal Threatened vernal pool fairy shrimp (*Branchinecta lynchi*), the Federal Endangered vernal pool tadpole shrimp (*Lepidurus packardii*), and the western spadefoot (*Spea hammondi*), a California Species of

Special Concern (SSC) These species are generally known from vernal pools located in open habitats of the Central Valley to the west and northwest Swainson's hawk (*Buteo swainsoni*), a California threatened species, generally nests in riparian woodland habitats and oak savannah of the Central Valley, often near water Nesting sites are usually located in isolated trees in open country within several miles of suitable foraging habitat. The study area occurs outside of the typical range of the species and does not provide suitable foraging or nesting habitat Bald eagles (*Haliaeetus leucocephalus*) require large bodies of water, or free-flowing rivers with nearby perches, including snags, large-limbed tall trees, or rocks near water Due to the lack of suitable nesting and foraging sites, this species is not expected to occur within the study area There are no structures within the study area or significant rock features that would support roosting of special-status bats known from the region including pallid bat (*Antrozous pallidus*), a SSC species

California red-legged frog (*Rana draytonii*), a federally threatened species and SSC species, prefers aquatic habitats with little or no flow, the presence of surface water to at least early June, surface water depths to at least 0.7 meter (2.3 feet), and the presence of fairly sturdy underwater supports such as cattails Only isolated populations of California red-legged frog (CRLF) have been documented in the Sierra Nevada foothills region (USFWS 2002) The closest documented occurrence is from approximately 7 miles east of the study area, in the foothills along the east side of Folsom Lake (CDFW 2014) In addition, existing literature indicates that CRLF was likely extirpated from the floor of the Central Valley prior to the 1960s (USFWS 2002) Due to the lack of habitat and the study area occurring outside of the current range of the species, there is no potential for occurrence of California red-legged frog onsite

Several of the identified animal species were ranked as "unlikely to occur" (Table 3), one was ranked as "Possible," and none were "Likely" or "Occurs" The discussions below include these species or those that require further clarification

Valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*) is a federal threatened species Live elderberry shrubs (*Sambucus nigra ssp caerulea*) are this borer's exclusive host plant Adult valley elderberry longhorn beetles (VELB) emerge from pupation inside the wood of these shrubs in the spring as their flowers begin to open Exit holes made by the emerging adults are distinctive small oval openings (approx 1/4-inch width) Elderberry shrubs that contain live stems of one inch or greater at ground level (USFWS 1999) are considered potential habitat for the species by the U.S. Fish and Wildlife Service Elderberry plants with no stems measuring 1.0 inch or greater at ground level are not considered habitat for the beetle No suitable habitat for VELB (live elderberry shrubs) was observed during previous surveys (NFA 2004b) or during the recent 2014 field assessment within the study area The absence of elderberry shrubs to date precludes the occurrence of VELB within the study area at this time, however, there is potential for new elderberry shrubs to grow and establish in the future and subsequently provide habitat for VELB Based on the absence of elderberries, there is currently no suitable habitat for VELB present within the study area In the event that elderberries become established onsite at any time in the future and stems grow to 1.0 inch or greater, occurrence of VELB would be possible

Central Valley Steelhead (*Oncorhynchus mykiss irideus*) is an anadromous form of rainbow trout that emigrates to sea and later returns to freshwater to spawn. Steelhead spawn in winter or early spring after salmon have typically spawned. They often require high water to provide access to upper watershed and spawning and rearing areas. Spawning occurs in clean, loose gravels and swift, shallow water. They generally prefer shallower stream depths and smaller gravel than salmon, but prefer similar water velocities. Juvenile steelhead often remain in freshwater for at least one year before out-migrating to the ocean. While in freshwater, young steelhead are typically found in cool, fast-flowing permanent streams and rivers where riffles predominate over pools and there is ample riparian and instream cover (NMFS 2009).

The CNDDDB (2014) documents steelhead as occurring in the Dry Creek system, mainly in two of its tributaries to the north including Secret Ravine and Miner's Ravine. Although steelhead are documented as occurring within the Dry Creek Watershed, the Granite Bay Community Plan indicates that Strap Ravine is not expected to provide suitable habitat for anadromous salmonids, including steelhead (Placer County 2012). Nearby tributaries that are known to provide suitable steelhead habitat include Miner's Ravine and Linda Creek, which is located downstream of Strap Ravine (Placer County 2004). The portion of Strap Ravine within the study area does not provide suitable rearing habitat for steelhead due to the absence of perennial surface water and pools, and may only be used seasonally as a migration corridor if steelhead are present within the drainage and there are no barriers to their movement.

Strap Ravine is not mapped as Critical Habitat for Central Valley Steelhead (Federal Register 2005). The closest mapped Critical Habitat unit for central valley steelhead is the mainstem of Dry Creek and two of its tributaries to the north, Miner's Ravine and Secret Ravine (NOAA 2005). Therefore, no designated critical habitat for this species occurs within or adjacent to the study area.

Western pond turtle (*Emys marmorata*), a SSC species, occurs in association with streams, rivers, and ponds containing suitable cover and basking sites. This species is normally associated with ponds, streams, lakes, marshes, and permanent pools along intermittent streams. Suitable basking sites along streams or ponds include partially submerged logs, rocks, mats of floating vegetation, or open streambanks. Suitable upland habitat, such as sandy banks or grassy fields, located adjacent to the aquatic habitat is required for egg-laying. Nesting takes place in a variety of soil types from loose sandy soils to compact soils, and in a variety of habitat types.

Suitable habitat for western pond turtle, consisting of ponds or deeper pools along streams, does not occur within the study area. The channel of Strap Ravine within the study area is very shallow and lacks the perennial deep pool habitat that pond turtles require. Any occurrence of pond turtles within the study area would be limited to individuals that periodically move up or downstream between suitable aquatic habitats located offsite.

Tricolored blackbird (*Agelaius tricolor*) is a highly colonial species that primarily nests in freshwater emergent wetlands. Nesting colonies of this species are considered sensitive by CDFW. This species generally requires open water, with protected nesting habitat, and suitable foraging areas close to the colony. Breeding and nesting typically takes

place in dense cattails or tules, and may also occur in thickets of willow, blackberry, wild rose, and tall herbs (Shuford and Gardali 2008) Nest sites are usually located a few feet over, or near, freshwater Nesting areas must be large enough to support a minimum colony of about 50 pairs Colonies may vary in size from about 50 nests to over 20,000 in an area of 10 acres or less Nesting typically occurs mid-April through late July

The CNDDDB documents nesting colonies of tri-colored blackbird within a 5-mile radius of the study area (CDFW 2014) The closest documented occurrence is from approximately one mile southwest just south of Eureka Road The blackberry thickets present within the study area, primarily along Strap Ravine, provide suitable nesting substrate for the species, but the amount of suitable foraging habitat available nearby is limited Due to the low quality of habitat available for the species, it is unlikely that tricolored blackbird would nest within the study area

White-tailed kite (*Elanus leucurus*), a California fully protected species, is an uncommon to locally fairly common resident and is typically found in grassy foothill slopes interspersed with oaks (including interior live oak, agricultural areas, and marshy bottomlands) They generally forage in undisturbed open grasslands, farmlands, meadows, and emergent wetlands, in areas with a high prey base Nest trees range from single isolated trees to trees within larger stands Nests of white-tailed kite are constructed near the top of oaks, willows, or other tall trees from 20 to 100 feet above ground Breeding takes place from February to October, with peak activity from May to August

The CNDDDB documents nesting occurrences of white-tailed kite within the project region (CDFW 2014) The closest documented nesting occurrence is from approximately 2 miles to the southwest Woodland areas located throughout the site provide marginal quality nesting habitat for white-tailed kite due to the limited amount of open foraging habitat (open woodland and annual grassland) in the surrounding area

California black rail (*Laterallus jamaicensis coturniculus*) is a scarce and secretive resident bird that occurs in saline, brackish, and freshwater wetlands (Zeiner et al 1990) Once mainly known from tidal marshes in the San Francisco Bay, it has recently been found in the Sierra Nevada foothills (Beedy and Pandolfino 2013) In the foothills region, it is known to occur in wet meadows and wetlands with dense emergent vegetation, such as cattails and bulrush, and having shallow, consistent water levels These birds regularly move around to new sites in response to changes in local conditions Nesting generally takes place from mid-March through early June

There are no documented occurrences of California black rail within a 5-mile radius of the study area (CNDDDB 2014) The closest documented occurrence of this species is from the north in a large, cattail-dominated wetland associated with Clover Valley Creek (2006) The seasonal wetlands, wetland swale, and riparian corridor of the study area do not provide habitat components considered suitable for the species (shallow, persistent surface water and dense emergent vegetation) Based on the marginal quality of habitat available and the rarity of the species within the region, it is unlikely California black rail would occur in wetlands of the study area

Purple martin (*Progne subis*) is an uncommon to rare, local summer resident in low-elevation woodlands of California (Shuford and Gardali 2008). They occur in a variety of woodlands, including oak woodland and riparian communities, as well as in low-elevation coniferous forests. Nesting usually takes place in tall, old trees or snags located near water. Nests are constructed in old woodpecker cavities, but are occasionally constructed in man-made structures such as culverts or under bridges. Purple martins arrive from South America in late March. Breeding then takes place from April to August, with peak activity in June. Depending on site availability, purple martins will sometimes nest colonially. Young of this species fledge at approximately 24 to 31 days (Zeiner et al. 1990).

The CNDDDB documents only one known occurrence of purple martin within the project region. This occurrence is from the northwest near the Highway 65 overpass over Taylor Road. Snags and tree cavities located throughout the site provide suitable nesting habitat for purple martin. Therefore, despite the rarity of this species within the region, nesting of purple martin within the study area is considered possible.

RECOMMENDATIONS

Waters of the United States

The study area contains areas that qualify as waters of the United States. Activities that place fill in these areas would require a permit from the U.S. Army Corps of Engineers pursuant to Section 404 of the federal Clean Water Act. The project would also need to obtain a water quality certification from the California Regional Water Quality Control Board pursuant to Section 401 of the federal Clean Water Act.

Streams, Pond, and Riparian Habitat

Impacts to the bed, bank, or channel of streams or ponds require a Streambed Alteration Agreement with the California Department of Fish and Wildlife (CDFW). In addition, Strap Ravine occurs within a hydrologic unit (HUC 20820111) considered Essential Fish Habitat for Chinook salmon by the National Marine Fisheries Service (NMFS). The Magnuson-Stevens Fishery Conservation and Management Act requires consultation with NMFS for projects that include a federal action or federal funding that may adversely modify EFH. Generally, EFH consultation involves a federal agency notifying NMFS regarding an action that may affect EFH, such as in the issuance of a Section 404 permit.

The Granite Bay Community Plan (Placer County 2012) identifies measures for protecting natural resources throughout the community. Policy 5.3.11 specifies that "new construction shall not be permitted within 100 feet of the centerline of permanent streams and 50 feet of intermittent streams, or within the 100 year floodplain whichever is greater." Other measures for protecting wetlands, riparian areas, and other sensitive habitats onsite are identified in Section 5.3 of the Granite Bay Community Plan.

Tree Conservation

Policy 5 3 15 of the Granite Bay Community Plan requires that Placer County's Tree Preservation Ordinance be implemented for all projects within the community of Granite Bay (Placer County 2012) The Tree Preservation Ordinance specifies requirements for the protection, preservation, and maintenance of native oak trees, trees of historic or cultural significance, groves and stands of mature trees, and mature trees in general, which are associated with proposals for development The applicant should consult with Placer County to determine what provisions of the ordinance are applicable

Special-Status Plants

The site contains marginal habitat for big-scale balsam-root and Sanford's arrowhead Because both of these species are CNPS Rank 1B species, Placer County may require surveys to determine if any individuals are present on site Should any individual special-status plant species be located within the study area, appropriate mitigation measures shall be developed in coordination with the Placer County Planning Department

Special-Status Wildlife

Pre-Construction Nesting Surveys

Foothill woodland throughout the site provides suitable nesting habitat for common raptors known from the region, such as red-shouldered hawk, Cooper's hawk and a few owls Suitable raptor nesting habitat includes mature pines, oaks, willows, and cottonwoods scattered throughout the site If tree removal activities take place during the associated breeding/nesting season for raptors (typically March 1 through August 31), disturbance of nesting activities could occur Take of any active raptor nest is prohibited under California Fish and Game Code Section 3503 5 To avoid take of active raptor nests, necessary tree removal should occur outside of the typical nesting season for raptors and other bird species If tree removal must occur at any time during the typical nesting season, a pre-construction survey should be conducted by a qualified biologist no more than 30 days prior to initiation of proposed development activities Pre-construction surveys will focus on all raptors having potential to occur onsite, including those with minimal potential for occurrence (white-tailed kite for this site) If active nests are found on or immediately adjacent to the site, CDFW should be contacted to determine appropriate avoidance measures If no nesting is found to occur, necessary tree removal could then proceed

The quality of habitat available for purple martin, tricolored blackbird, and California black rail within the study area is considered marginal, and consequently, the potential for occurrence is very low It is possible that purple martin may nest within the study area due to the presence of numerous snags and cavities in mature trees throughout site Although nesting of these three species within the study area is unlikely, implementation of pre-construction surveys is recommended to avoid any potential disturbance of these species Take or destruction of an active nest of any bird is prohibited under California Fish and Game Code Section 3503 Pre-

construction surveys should be implemented by a qualified biologist if ground disturbance occurs at any time during the typical nesting season (generally March through July depending on species) If no nesting activity is detected within proposed work areas, construction activities could then proceed If, however, active nests are found, construction should be avoided until after the young have fledged or upon approval from CDFW

Additional Avoidance Measures

The study area lacks perennial pools and ponds preferred by western pond turtle, and therefore, any occurrence would be limited to individuals moving up or down the drainage between suitable habitats located off site Although occurrence of western pond turtle is unlikely, implementation of Policy 5 3 11 of the Granite Bay Community Plan (stream setbacks) would limit disturbance of any individual pond turtles that may use Strap Ravine as a movement corridor

Strap Ravine is not likely to support steelhead due to the limited amount and low quality of habitat available throughout the drainage In the unlikely event steelhead occur in the drainage, the portion of Strap Ravine within the study area would only be used as migration corridor when flows are sufficient. Implementation of Policy 5 3 11 of the Granite Bay Community Plan (stream setbacks) would limit disturbance of potential habitat for steelhead along Strap Ravine

Appendix A.
Plant Species Observed Within the Creekside Oaks Study Area

Appendix A

Plants Observed - Creekside Oaks - 2014

Ferns and Allies

Equisetaceae - Horsetail Family

Equisetum arvense

Common horsetail

Gymnosperms

Pinaceae - Pine Family

Pinus sabiniana

Gray pine

Angiosperms - Dicots

Anacardiaceae - Cashew or Sumac Family

Toxicodendron diversilobum

Western poison-oak

Apiaceae (Umbelliferae) - Carrot Family

**Anthriscus caucalis*

Bur chervil

**Daucus carota*

Queen Anne's lace

**Foeniculum vulgare*

Sweet fennel

Sanicula bipinnatifida

Purple sanicle

**Taraxacum officinale*

Field hedgeparsley

Apocynaceae - Dogbane/Milkweed Family

Asclepias fascicularis

Narrow leaf milkweed

Aristolochiaceae - Pipevine Family

Aristolochia californica

California pipevine

Asteraceae (Compositae) - Sunflower Family

Ambrosia psilostachya

Western ragweed

Ariemisia douglasiana

California mugwort

Baccharis pilularis

Coyote brush

Bidens frondosa

Sticktight

**Carduus pycnocephalus*

Italian thistle

**Centaurea solstitialis*

Yellow starthistle

Centromadia fitchii

Fitch's spikeweed

**Chondrilla juncea*

Skeleton weed

**Cichorium intybus*

Chicory

**Cirsium vulgare*

Bull thistle

Erigeron canadensis

Canadian horseweed

Euthamia occidentalis

Western goldenrod

**Helminthotheca echioides*

Bristly ox-tongue

Holocarpha virgata subsp. virgata

Virgate tarweed

**Lactuca scariola*

Prickly lettuce

**Mairicaria discoidea*

Pineapple-weed

Micropus californicus var. californicus

Cotton-top

**Senecio vulgaris*

Common groundsel

**Silybum marianum*

Milk thistle

**Sonchus asper subsp. asper*

Prickly sow thistle

**Tragopogon dubius*

Yellow salsify

* Indicates a non native species

<i>Wyethia angustifolia</i>	Narrowleaf mule's-ears
<i>Xanthium strumarium</i>	Cocklebur
Brassicaceae (Cruciferae) - Mustard Family	
* <i>Brassica nigra</i>	Black mustard
* <i>Hirschfeldia incana</i>	Short podded mustard
* <i>Raphanus sativus</i>	Wild radish
Caprifoliaceae - Honeysuckle Family	
<i>Symphoricarpos mollis</i>	Creeping snowberry
Caryophyllaceae - Pink Family	
* <i>Petrohragia dubia</i>	Grass pink
* <i>Silene gallica</i>	Windmill-pink
* <i>Stellaria media</i>	Common chickweed
Chenopodiaceae - Goosefoot Family	
* <i>Chenopodium album</i>	White pigweed
Convolvulaceae - Morning-Glory Family	
* <i>Convolvulus arvensis</i>	Bindweed
Euphorbiaceae - Spurge Family	
<i>Croton setiger</i>	Turkey mullein
Fabaceae (Leguminosae) - Legume Family	
* <i>Lotus corniculatus</i>	Bird's foot trefoil
<i>Lupinus bicolor</i>	Miniature lupine
* <i>Medicago polymorpha</i>	California burclover
* <i>Trifolium dubium</i>	Little hop clover
* <i>Trifolium hirtum</i>	Rose clover
* <i>Vicia sativa</i>	Common vetch
* <i>Vicia villosa</i>	Winter vetch
Fagaceae - Oak Family	
<i>Quercus douglasii</i>	Blue oak
<i>Quercus lobata</i>	Valley oak
<i>Quercus wislizeni</i>	Interior live oak
Geraniaceae - Geranium Family	
* <i>Frodium botrys</i>	Broad leaf filaree
<i>Erodium cicutarium</i>	Red-stem filaree
* <i>Geranium molle</i>	Dove's foot geranium
Haloragaceae - Water-Milfoil Family	
* <i>Myriophyllum aquaticum</i>	Parrot's feather
Hypericaceae - St. John's Wort Family	
* <i>Hypericum perforatum subsp. perforatum</i>	Klamathweed
Lamiaceae (Labiatae) - Mint Family	
* <i>Lamium amplexicaule</i>	Deadnettle
* <i>Marrubium vulgare</i>	White horehound
* <i>Mentha pulegium</i>	Pennyroyal
<i>Stachys ajugoides</i>	Bugle hedge-nettle
Lythraceae - Loosestrife Family	
* <i>Lythrum hyssopifolia</i>	Hyssop loosestrife
Montiaceae - Miner's Lettuce Family	
<i>Calandrinia ciliata</i>	Red maids
<i>Claytonia perfoliata</i>	Common miner's lettuce

Myrsinaceae - Myrsine Family

**Lysimachia arvensis*

Scarlet pimpernel

Onagraceae - Evening Primrose Family

Clarkia purpurea subsp purpurea

Purple clarkia

Clarkia unguiculata

Canyon clarkia

Epilobium brachycarpum

Summer cottonweed

Epilobium ciliatum

Hairy willow herb

Epilobium densiflorum

Dense flower spike primrose

**Ludwigia peploides*

Water Primrose

Papaveraceae - Poppy Family

Eschscholzia californica

California poppy

Phrymaceae - Lopseed Family

Diplacus aurantiacus

Orange bush monkeyflower

Erythranthe guttata

Common monkeyflower

Phytolaccaceae - Pokeweed Family

**Phytolacca americana var americana*

Pokeweed

Plantaginaceae - Plantain Family

**Plantago lanceolata*

English plantain

Polygonaceae - Buckwheat Family

Eriogonum nudum

Naked wild buckwheat

Persicaria lapathifolia

Willow weed

**Polygonum aviculare*

Common knotweed

**Rumex acetosella*

Sheep sorrel

**Rumex crispus*

Curly dock

**Rumex pulcher*

Fiddle dock

Ranunculaceae - Buttercup Family

**Ranunculus muricatus*

Spiny fruit buttercup

Rhamnaceae - Buckthorn Family

Ceanothus cuneatus var cuneatus

Buck brush

Frangula californica subsp tomentella

Hairy coffeeberry

Rosaceae - Rose Family

Heteromeles arbutifolia

Toyon

Prunus sp

Prunus

**Pyracantha angustifolia*

Fircthorn

**Rubus armeniacus*

Himalayan blackberry

Rubus ursinus

California blackberry

Rubiaceae - Madder Family

Galium aparine

Goose grass

Galium porrigens var tenue

Climbing bedstraw

Salicaceae - Willow Family

Populus fremontii subsp fremontii

Fremont cottonwood

Salix exigua

Narrow leaved willow

Salix laevigata

Red willow

Salix lasiandra var lasiandra

Pacific willow

Scrophulariaceae - Figwort Family

**Verbascum blattaria*

Moth mullein

**Verbascum thapsus*

Woolly mullein

Verbenaceae - Vervain Family

**Verbena bonariensis*

South American vervain

Viscaceae - Mistletoe Family

Phoradendron leucarpum subsp. *tomentosum*

Oak mistletoe

Angiosperms - Monocots

Agavaceae - Agave Family

Chlorogalum pomeridianum var. *pomeridianum*

Soap plant

Alismataceae - Water-Plantain Family

Alisma triviale

California water plantain

Cyperaceae - Sedge Family

Carex praegracilis

Clustered field sedge

Carex sp

Sedge

**Cyperus difformis*

Variable flatsedge

Cyperus eragrostis

Tall flatsedge

Eleocharis macrostachya

Creeping spikerush

**Eleocharis pachycarpa*

Black sand spikerush

Schaenoplectus acutus var. *occidentalis*

Common tule

Juncaceae - Rush Family

Juncus bufonius

Toad rush

**Juncus effusus*

Soft rush

Juncus mexicanus

Mexican rush

Juncus ziphioides

Iris leaved rush

Poaceae (Gramineae) - Grass Family

**Aira caryophyllea*

Silver European hairgrass

**Avena fatua*

Wild oat

**Briza minor*

Small quaking grass

**Bromus diandrus*

Ripgut grass

**Bromus hordeaceus*

Soft chess

**Cynodon dactylon*

Bermudagrass

**Cynosurus echinatus*

Hedgehog dogtail

Deschampsia danthonioides

Annual hairgrass

**Elymus caput-medusae*

Medusahead

Elymus glaucus

Blue wildrye

**Festuca myuros*

Rattail sixweeks grass

**Festuca perennis*

Italian ryegrass

**Holcus lanatus*

Common velvet grass

**Hordeum maritimum* subsp. *gussoneanum*

Mediterranean barley

**Hordeum murinum*

Wall barley

**Leersia oryzoides*

Rice cutgrass

Muhlenbergia rigens

Deer grass

Paspalum distichum

Knotgrass

**Poa annua*

Annual bluegrass

**Polypogon monspeliensis*

Annual beard grass

Themidaceae - Brodiaea Family

Brodiaea elegans subsp. *elegans*

Elegant harvest brodiaea

Dichelostemma capitatum subsp. *capitatum*

Bluedicks

Typhaceae - Cattail Family

Typha latifolia

Broad leaved cattail

Appendix D
Potentially-Occurring Special-Status Animals in the Region of the Creekside Oaks
Study Area

Appendix D
Potentially-Occurring Special-Status Wildlife- Creekside Oaks

	Status*		Habitat	Probability on Project Site
Invertebrates				
Vernal pool fairy shrimp <i>Branchinecta lynchi</i>	Fed State Other	FT - -	Vernal pools and other temporary bodies of water in southern and Central Valley of California. Most common in smaller grass or mud bottomed swales or basalt flow depression pools in unplowed grasslands.	None. No suitable habitat (vernal pools) present onsite.
Vernal pool tadpole shrimp <i>Lepidurus packardii</i>	Fed State Other	FE - -	Found in vernal pools in the Central Valley of California and in the San Francisco Bay area. Inhabits vernal pools with clear to highly turbid water.	None. No suitable habitat (vernal pools) present onsite.
Conservancy fairy shrimp <i>Branchinecta conservatio</i>	Fed State Other	FE - -	Endemic to the Central Valley and southern coastal regions of California. Prefers larger, turbid, cool water vernal pools located in alluvial swales.	None. No suitable habitat present onsite. Located outside of known range.
Insects				
Valley elderberry longhorn beetle <i>Desmocerus californicus dimorphus</i>	Fed State Other	FT - *	Requires host plant elderberry (<i>Sambucus</i> spp.) for most of its life cycle. Shrubs must have stem diameters at ground level of 1.0 inch or greater and shrubs must be found less than 3,000 feet in elevation. Typically riparian and upland associated.	Unlikely. No suitable habitat (elderberry shrubs) observed during field surveys.
Fish				
Steelhead Central Valley ESU <i>Oncorhynchus mykiss irideus</i>	Fed State Other	FT - -	Occurs below man-made impassable barriers in the Sacramento and San Joaquin rivers and tributaries. Adults migrate from ocean to natal freshwater streams to spawn. Yuba River has essentially the only remaining wild steelhead fishery in Central Valley.	Unlikely. Marginal quality aquatic habitat observed onsite in association with Strap Ravine. Known occurrences throughout Dry Creek system.
Central Valley spring-run Chinook salmon <i>Oncorhynchus tshawytscha</i>	Fed State Other	FT CT -	ESU covers spring-run salmon in Sacramento River and primarily found in the following tributaries: Butte, Big Chico, Deer, and Mill creeks and the Feather River.	None. No suitable aquatic habitat present onsite. Located outside of known range.
Delta smelt <i>Hypomesus transpacificus</i>	Fed State Other	FT CT -	Endemic to the Sacramento-San Joaquin Delta in coastal and brackish waters. Occurs seasonally in Suisun and San Pablo bays. Spawning usually occurs in dead-end sloughs and shallow channels.	None. No suitable habitat present onsite. Located outside of species' range.

Appendix D
Potentially-Occurring Special-Status Wildlife- Creekside Oaks

	Status*	Habitat	Probability on Project Site
Amphibians			
California tiger salamander <i>Ambystoma californiense</i>	Fed FT State CT Other	Occurs in annual grassland habitat (<1500 feet) and occasionally in grassy understory of valley foothill hardwood habitats where lowland aquatic sites are available for breeding. Breeds primarily in vernal pools.	None. No suitable habitat present onsite. Located outside of species range. No known occurrences in Placer County.
Western spadefoot <i>Spea hammondi</i>	Fed State SSC Other	Found primarily in grassland habitats, but may occur in valley and foothill woodlands. Requires vernal pools, seasonal wetlands, or stock ponds for breeding and egg laying. Prefers more turbid pools for predator avoidance.	None. No suitable aquatic breeding habitat onsite. Generally known from valley floor to west and northwest.
California red legged frog <i>Rana draytonii</i>	Fed FT State SSC Other	Occurs in lowlands and foothills in deeper pools and slow-moving streams, usually with emergent wetland vegetation. Requires 11-20 weeks of permanent water for larval development.	None. No suitable habitat present onsite. Only one documented occurrence in Placer County. Site located outside of species' current range. Thought to be extirpated from valley floor.
Reptiles			
Western pond turtle <i>Emys marmorata</i>	Fed State SSC Other	Inhabits ponds, marshes, rivers, streams, and irrigation ditches with aquatic vegetation. Needs suitable basking sites and upland habitat for egg laying.	Unlikely. No suitable aquatic habitat observed within study area. Individuals may move up and down stream corridor and between suitable habitats located off site.
Giant garter snake <i>Thamnophis gigas</i>	Fed FT State CT Other	Primarily associated with marshes and sloughs, less with slow-moving creeks, and absent from larger rivers. Nocturnal retreats include mammal burrows and crevices. During the day basks on emergent vegetation such as cattails and tules.	None. No suitable aquatic habitat present onsite. Located outside of species' range.
Birds			
White-tailed kite <i>Elanus leucurus</i>	Fed State CFP Other -	Found in lower foothills and valley margins with scattered oaks and along river bottomlands or marshes adjacent to oak woodlands. Nests in trees with dense tops.	Unlikely. Prefers nesting closer to open foraging areas including grassland and agricultural areas. Not expected to nest onsite.
Bald eagle <i>Haliaeetus leucocephalus</i>	Fed State CE Other CFP	Occurs along shorelines, lake margins, and rivers. Nests in large old-growth or dominant trees with open branches.	None. No suitable foraging habitat located in vicinity of study area and no suitable nesting onsite.

Appendix D
Potentially-Occurring Special-Status Wildlife- Creekside Oaks

	Status*	Habitat	Probability on Project Site
Swainson s hawk <i>Buteo swainsoni</i>	Fed State CT Other *	Breeds in open areas with scattered trees prefers riparian and sparse oak woodland habitats Requires nearby grasslands grain fields or alfalfa for foraging Rare breeding species in Central Valley	None No suitable nesting or foraging habitat present onsite Located outside of typical range for species
Golden eagle <i>Aquila chrysaetos</i>	Fed - State CFP Other	Found in rolling foothill grassland with scattered trees Nests on cliffs and in large trees in open areas	None No suitable habitat present onsite.
California black rail <i>Laterallus jamaicensis coturniculus</i>	Fed State CT Other CFP	Inhabits salt, fresh, and brackish water marshes with little daily and/or annual water fluctuations In freshwater habitats preference is for dense bulrush and cattails Several scattered populations documented from Butte Co to southern Nevada Co	Unlikely Onsite wetlands do not provide habitat components preferred by species Wetlands are lacking persistent shallow surface water and suitable cover
Burrowing owl <i>Athene cunicularia</i>	Fed State SSC Other *	Found in annual and perennial grasslands Nests in burrows dug by small mammals primarily ground squirrels	None No suitable burrowing habitat present onsite
Purple martin <i>Progne subis</i>	Fed State SSC Other *	Breeds in riparian woodland oak woodland, open coniferous forests Secondary cavity nester Requires nest sites close to open foraging areas of water or land.	Possible Numerous snags and cavities in mature trees throughout site provide suitable nesting habitat Prefers sites located along ridgelines or on hillsides and near expansive open foraging areas
Bank swallow <i>Riparia riparia</i>	Fed State CT Other *	Colonial nester near riparian and other lowland habitats Requires vertical banks or cliffs with fine-textured, sandy soils near streams rivers and lakes	None No suitable nesting habitat present onsite No occurrences within 5 mile radius
Grasshopper sparrow <i>Ammodramus saviannarum</i>	Fed State SSC Other	Breeds in grasslands and savannahs in rolling hills and lower mountain hillsides up to 5000 feet elevation	None No suitable nesting habitat present onsite Rare in project region
Tricolored blackbird <i>Agelaius tricolor</i>	Fed State SSC Other	Colonial nester in dense cattails, tules brambles or other dense vegetation Requires open water dense vegetation, and open grassy areas for foraging.	Unlikely Marginal quality nesting habitat onsite Limited amount of open foraging habitat available

Appendix D
Potentially-Occurring Special-Status Wildlife- Creekside Oaks

	Status*	Habitat	Probability on Project Site
Mammals			
Pallid bat <i>Antro-ous pallidus</i>	Fed State SSC Other *	Occurs in grasslands woodlands deserts & urban habitats open habitat required for foraging. Common in dry habitats with rocky outcrops cliffs and crevices for roosting. Roosts include caves mines bridges & occasionally hollow trees, buildings	None No suitable roosting habitat present onsite
American badger <i>Taxidea taxus</i>	Fed State CSC Other	Occurs in dry open soils in herbaceous shrub and forest habitats Needs friable uncultivated soil Preys on rodents	None No suitable habitat onsite No evidence of species occurrence observed No occurrences with 5-mile radius

MEMORANDUM

To: Rob Wilson

cc: Dave Cook

From: Jeff Glazner

Date: May 26, 2016

Subject: Pre-Fuel Load Reduction bird survey – Whitehawk I property, Granite Bay

At your request, Salix Consulting conducted a nesting bird survey on the ±17-acre Whitehawk I property located on the south side of Douglas Boulevard, just east of Sierra College Boulevard and Woodgrove Way in the community of Granite Bay, Placer County, CA. This survey was conducted at the direction of the County of Placer Community Development Resource Agency as directed in Tree Permit PLN16-00107.

Methodology

The survey was conducted by Salix Consulting's Wildlife Biologist and Assistant Biologist and consisted of two (2) site visits conducted on May 9 and 13, 2016. The May 9 site visit occurred from 5pm to 7pm. Skies were clear, and a slight breeze occurred throughout the survey. The May 13 visit occurred from 9 am to 3:30 pm. The temperature during the visit ranged from 70-85 degrees Fahrenheit, and the day was clear and calm.

During each site visit all habitats within the study area were walked to look for birds and potential nesting activity and to listen for bird vocalizations. All birds detected were identified and documented. Any potential nesting activity observed was also noted. Binoculars were used to scan the study area, particularly taller trees throughout the site, from various vantage points to identify birds present and any nesting activity. Many of the birds were identified through vocalizations.

Survey Results and Recommendations

The following birds were identified by direct observation and/or vocalization:

Acorn woodpecker

Black phoebe

American robin

Brewer's blackbird

Anna's hummingbird

Bushtit

California towhee
California valley quail
Cooper's hawk
European starling
Great horned owl (juvenile and adult)
Hairy woodpecker
House sparrow
House wren
Mallard

Mourning dove
Phainopepla
Red-tailed hawk
Red-shouldered hawk
Red-winged blackbird
Spotted towhee
Tree swallow
Turkey vulture
Western scrub jay
Wild turkey

The following nesting activity or active nests were observed, and their locations are shown by number on the attached exhibit. Recommendations are included with each observation.

Nest #1: Cooper's Hawk. Chicks present. Whitewash and molted feathers present. Nest is in live oak ±40 feet above ground, adjacent to small clearing.

Recommendation:

Prior to the commencement of heavy work within a 500-foot buffer of nest, have a biological monitor check current status of nest. If the chicks have not yet fledged, avoid heavy work within the 500-foot buffer of nest. With a monitor present, it may be possible to conduct work closer than 500 feet, if needed. The monitor should closely monitor the hawks and have the authority to stop advancing work and set a boundary if necessary. Preferably, the longer that work can stay out of this area, the better. Estimated possible fledge date range: late May.

Nest #2: Red-tailed hawk. Chicks present. Rufous feathers seen from ground, and red-tailed hawk adult circling nest. Nest is ±80 feet high in cottonwood near edge of forest.

Recommendation:

Prior to the commencement of heavy work within a 500-foot buffer of nest, have a biological monitor check current status of nest. If the chicks have not yet fledged, avoid heavy work within the 500 foot buffer of nest. With a monitor present, it may be possible to conduct work closer than 500 feet if needed. The monitor should closely monitor the hawks and have the authority to stop work if needed. Estimated possible fledge dates: May 26 - June 11.

Nest #3: Red-shouldered hawk. Whitewash present but no current activity within nest. Large juvenile nearby. Expected to be fully fledged within two weeks of last survey date (May 13).

Recommendation:

No avoidance measures required.

Nest #4: Mallard pair with ducklings. Observed in riparian area.

Recommendation:

Avoid riparian area as planned.

Nest #5: Turkey with five poults. Poults are mobile.

Recommendation:

Allow turkey and poults to flush from area if encountered.

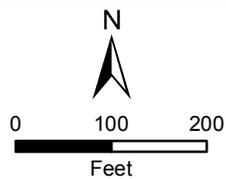

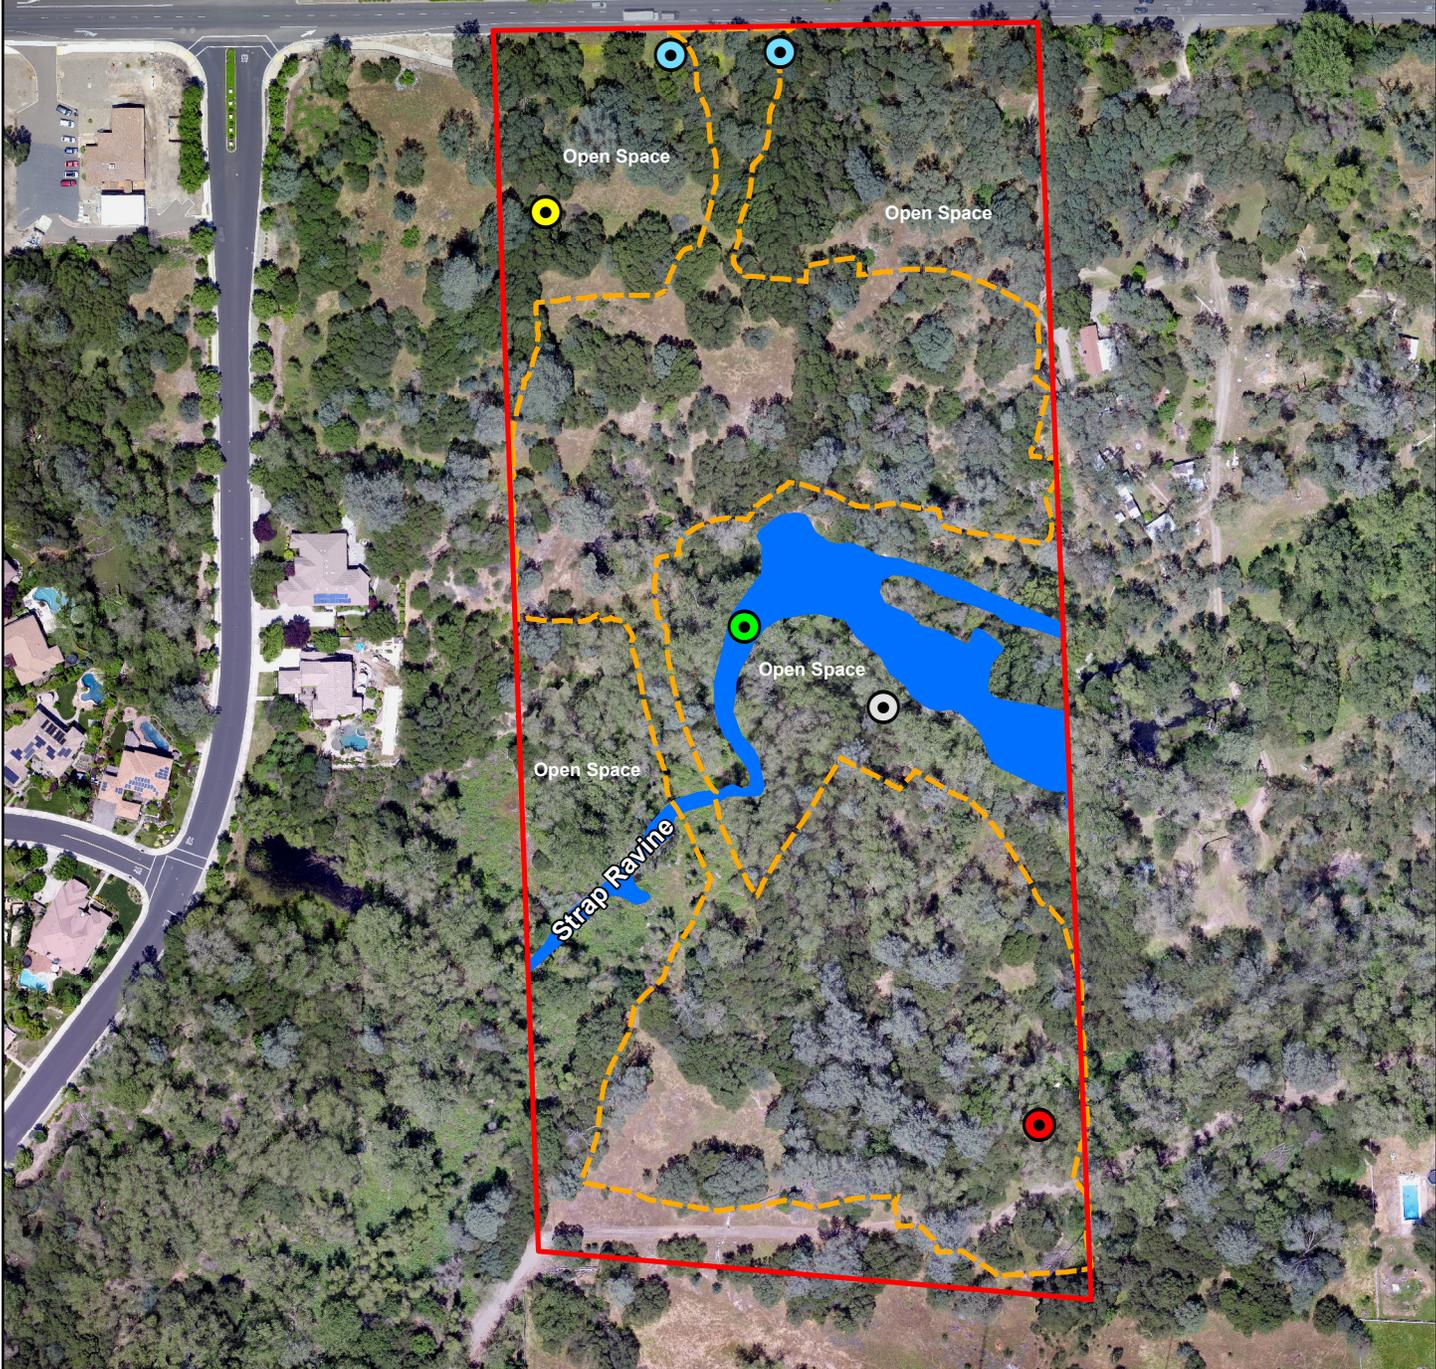

Nest #6: Turkey with at least two poults. Poults are mobile.

Recommendation:

Allow turkey and poults to flush from area if encountered.

RAPTOR AND MIGRATORY BIRD SURVEY

Whitehawk I

Granite Bay, Placer County, CA

MEMORANDUM

To: Rob Wilson

cc: Dave Cook

From: Jeff Glazner

Date: May 26, 2016

Subject: Pre-Fuel Load Reduction bird survey – Whitehawk II property, Granite Bay

At your request, Salix Consulting conducted a nesting bird survey on the ±33-acre Whitehawk II property located on the south side of Douglas Boulevard, just east of Sierra College Boulevard and Woodgrove Way in the community of Granite Bay, Placer County, CA. This survey was conducted at the direction of the County of Placer Community Development Resource Agency as directed in Tree Permit PLN16-00107.

Methodology

The surveys were conducted by Salix Consulting's Wildlife Biologist and Assistant Biologist and consisted of three (3) site visits conducted on May 10, 11, and 12. The May 10 visit occurred from 1 pm to 7pm. The May 11 visit occurred from 9:30 am to 7pm. The May 12 visit occurred from 9am to 2pm. Skies were clear, and a slight breeze occurred throughout the survey. The temperature during the visits ranged from 70-85 degrees Fahrenheit, and the days were clear and calm.

During each site visit all habitats within the study area were walked to look for birds and potential nesting activity and to listen for bird vocalizations. All birds detected were identified and documented. Any potential nesting activity observed was also noted. Binoculars were used to scan the study area, particularly taller trees throughout the site, from various vantage points to identify birds present and any nesting activity. Many of the birds were identified through vocalizations.

Survey Results and Recommendations

The following birds were identified by direct observation and/or vocalization:

Acorn woodpecker

American robin

American crow

Anna's hummingbird

Ash-throated flycatcher
Barn owl
Black phoebe
Brewer's blackbird
Bushtit
California towhee
California valley quail
Canada goose
Cooper's hawk
European starling
House finch
House sparrow
House wren

Hutton's vireo
Mourning dove
Oak titmouse
Red-shouldered hawk
Red-tailed hawk
Spotted towhee
Tree swallow
Turkey vulture
Western scrub jay
White crowned sparrow
White-tailed kite
Wild turkey
Wood duck and ducklings
Yellow warbler

The following nesting activity or active nests were observed, and their locations are shown by number on the attached exhibit. Recommendations are included with each observation.

Nest #1: Cooper's Hawk. Eggs present.

Recommendations:

Prior to the commencement of heavy work within a 500-foot buffer of nest, have a biological monitor check current status of nest. If the chicks have not yet fledged, avoid heavy work within the 500-foot buffer of nest. With a monitor present, it may be possible to conduct work closer than 500 feet if needed. The monitor should closely monitor the hawks and have the authority to stop advancing work and set a boundary if necessary. Preferably, the longer that work can stay out of this area, the better. Estimated fledge dates: June 21- July 13.

Nest #2: House wren. Chicks present in cavity nest in dead snag.

Recommendation:

Have a biological monitor confirm the nest is no longer active prior to start of work. If nest is still active, avoid heavy work within 50 foot buffer of nest, or a 25 foot buffer with a biological monitor present to monitor for signs of distress. Probable fledge dates: May 16-May 29.

Nest #3: Wood duck with ducklings.

Recommendation:

Avoid the pond as planned. No additional avoidance measures required.

Possible new nest #4: Red-shouldered hawk. Pair observed copulating in southwest corner of site, with multiple unoccupied nest structures present. High likelihood of a new nest becoming active in the area prior to construction.

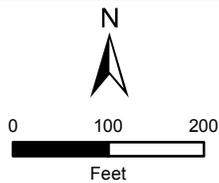

Recommendation:

Prior to commencement of work, have a biologist check area for newly occupied nests. Expect possible constraints for ± 80 days if new nest becomes occupied. If

an active nest is found, avoid heavy work within a 500-foot buffer of nest. With a monitor present, it may be possible to conduct work closer than 500 feet, if needed. The monitor should closely monitor the hawks and have the authority to stop advancing work and set a boundary if necessary.

Survey Dates: May 10-12, 2016

- 1.  Cooper's Hawk Nest
- 2.  House Wren Nest
- 3.  Wood Duck w/ Ducklings
- 4.  Inactive, Potential New Red-Shouldered Hawk Nest

Executive Summary:

Jeff Glazner of Salix Consulting, Incorporated contracted **ABACUS** to evaluate and inventory the oak trees on the Creekside Oaks project site in Granite Bay, Placer County, California, and to produce the end product, an Arborist Report and Oak Tree Inventory.

ABACUS was on site from Tuesday, August 5th, 2014 to Tuesday, October 14, 2014; providing on-site tagging, identifications, number of trunks, DBH measurements, field condition notes, recommended actions, and ratings of the trees.

A total of **431 oak** trees which met the Placer County Tree Preservation qualifications were tagged and evaluated. **ABACUS** has provided guidance for each of the trees in the form of the action column of **Chart B**, a discussions section, a specific recommendations section, a general recommendations section, and in the Tree Site Map at the end of this report.

- 1) **3** trees are rated a **0** (“dead”) and should be removed immediately.
- 2) A total of **130** trees are rated **1** (“dangerous”) and noted for immediate removal due to their poor condition.
- 3) There are **192** trees rated a **2** (“poor”) and are noted for removal due to their poor condition. Trees in this category may be retained if all of the recommendations are followed to reduce risk.
- 4) **107** of the trees are rated **3** (“fair”), or **4** (“good”).
- 5) There is **no** trees rated a **5** (“excellent”).

There are **433** total trees inventoried, of which **2** are protected species but are too small for protection, **80** are Blue Oak, **25** are Valley Oak, and **324** are Interior Live Oak.

The community and Placer County want the trees protected by species and size and currently require the quality oak trees 6” dbh and greater to be protected at all times and accounted for **before** construction work has begun, and after completion. Our list of general recommendations and specific recommendations, as well as the action column in **Chart B**, listed in this report are required for protection of these trees.

Assignment:

Pursuant to your request, **ABACUS** has completed an inventory and evaluation of trees located within the development area; providing on-site tagging, as well as species identification, number of stems, DBH measurements, field condition notes, recommended actions, and ratings. The trees are located on Douglas Boulevard in Placer County, California.

Observations:

Nicole Harrison, ISA Certified Arborist #WE-6500AM-TRAQ, Joey Bena, ISA Certified Arborist #WE-10409A, Julie McNamara, Arborists Assistant, Michael McNamara, Arborists Assistant, and Nicholas McNamara, Arborists Assistant, inventoried, evaluated and tagged all trees that were 6" in diameter measured at 4-1/2' above ground level or at Diameter Breast Height (DBH). The fieldwork was completed Tuesday, August 5th, 2014 to Tuesday, October 14, 2014.

The protected trees (on-site) tagged by **ABACUS** have a numbered tag, placed on each one that is 1-1/8" x 1-3/8", green anodized aluminum, "acorn" shaped, and labeled: **ABACUS**, Auburn, CA with 1/8" pre-stamped tree number, our phone number 530-889-0603, attached with a natural colored aluminum 10d (3") nail, installed at 6 feet above ground level. The tag should last ~10 – 20+ years depending on the species before it is enveloped by the trees' normal growth cycle, as the tags are not nailed flush to the trunk.

The proposed development map and tree locations were provided by TSD Engineering. All of the other information regarding the trees within this report and on the Tree Site Map was by **ABACUS**.

Chart B in this report is an inventory on the protected trees. The following terms, and **Chart A** will further explain our findings on **Chart B** and the trees in question.

Species of trees is listed by our local and correct common name and botanical name by genus (capitalized) and species (lower case). Oaks frequently cross-pollinate and hybridize, but the identification is towards the strongest characteristics.

Stems refers to the quantity of trunks or stems of a tree that have a significant connection. If one stem or trunk were to be removed, it would cause decay to harm an adjoining stem, making it one tree. All stems must be of the same species. (Also see "Tree SIZE Expressed by Trunk Diameter" at the end of this report)

DBH (diameter breast high) is normally measured at 4'6" (above the average ground height for "Urban Forestry"), but if that varies then the location where it is measured is noted here. A Swedish caliper¹ was used to measure the DBH for trees less than 26" in diameter and a steel diameter tape² for trees greater than 26"Ø.

Rating is subjective to health and structure = condition. All of the trees were also rated for condition, per the recognized national standard as set up by the Council of Tree and Landscape Appraisers and the International Society of Arboriculture (ISA) on a numeric scale of 5 (being the highest) to zero (the worst condition, dead) as in **Chart A**. The rating was done in the field at the time of the measuring and inspection. The scale is as follows:

¹DBH or dbh, "Diameter Breast high" is the diameter of the tree's trunk in inches, measured 4' 6" off the ground (for more information see "Tree SIZE Expressed by Trunk Diameter" at the end of this report).

¹A large wooden sliding adjustable thickness gauge calibrated in 1/16" increments.

²Diameter Tape is used to figure the tree's diameter, by measuring the circumference, whereon the inches are pre-multiplied by 3.14 or π (π called pi) and shown to produce the diameter of the tree directly on the tape.

Chart A

No problem(s)	5	excellent
No apparent problem(s)	4	good
Minor problem(s)	3	fair
Major problem(s)	2	poor
Extreme problem(s)	1	hazardous or dangerous
Dead	0	dead

There is a very important line drawn between a tree rated a **3** and a **2**. A rating of **3 – 4 – 5** means that they are trees to be preserved and kept. A rating of a **0 – 1 – 2** is a tree that is recommended for removal and is a liability rather than an asset. On the following tree list **BLACK** marks are field notes and action items on trees that are to remain, and **RED** are trees that are recommended for removal. Trees rated a **2** may be retained but only if the recommendations are followed, otherwise the tree should be removed.

Rating #0: This indicates a tree that has no significant sign of life.

Rating #1: The problems are extreme. This rating is assigned to a tree that has structural and/or health problems that no amount of work or effort can change. The issues may or may not be considered a dangerous situation.

Rating #2: The tree has major problems. If the option is taken to preserve the tree, its condition could be improved with correct arboricultural work including, but not limited to: pruning, cabling, bracing, bolting, guying, spraying, mistletoe removal, vertical mulching, fertilization, etc. If the recommended actions are completed correctly, hazard can be reduced and the rating can be elevated to a 3. If no action is taken the tree is considered a liability and should be removed.

Rating #3: The tree is in fair condition. There are some minor structural or health problems that pose no immediate danger. When the recommended actions in an arborist report are completed correctly the defect(s) can be minimized or eliminated.

Rating #4: The tree is in good condition and there are no apparent problems that a Certified Arborist can see from a visual ground inspection. If potential structural or health problems are tended to at this stage future hazard can be reduced and more serious health problems can be averted.

Rating #5: No problems found from a visual ground inspection. Structurally, these trees have properly spaced branches and near perfect characteristics for the species. Highly rated trees are not common in natural or developed landscapes. No tree is ever perfect especially with the unpredictability of nature, but with this highest rating, the condition should be considered excellent.

Notes: explain why the tree should be removed or preserved. If it is to remain and be preserved the tree may need some form of work to limit future liability from partial or total failure. Lower deadwood may not be an immediate problem, but the same size wood at a much higher location on the trees could be dangerous and might cause a minor injury to a fatal blow if the branch failed.

Common Terms:

CDL: Co-Dominant Leader: Stems or trunks of the tree that are equal in size and relative importance.

NAA: Narrow Attachment: A sharp “V” crotch, usually less than a 45° angle of attachment. Included bark is explained above and is common in branches with narrow attachments. In addition, these branches may not be attached to the trunk as well as others with wider angles of attachment, and can fail more frequently depending on the size of the branch.

TBR: To Be Removed: Tree to be removed due to health and/or structural reasons. Removal should be done carefully as to not harm the surrounding trees, branches, and/or trunks above or roots below ground. Do NOT rip out or push over the tree stumps if they are near other trees that are to be preserved. Cut them off close to ground level and leave the stumps and roots to decay, unless they are located within a proposed foundation or area to be paved/concrete surfaced.

UC: Unbalanced Canopy: Either the trunk is leaning and/or the canopy is phototropic and overly heavy on one side.

Compass Points: These are the standard 16 points of the compass as aligned with Geographic North or True North. In our area, True North (TN) is adjusted for declination 14°49’ to the west of Magnetic North (MN).

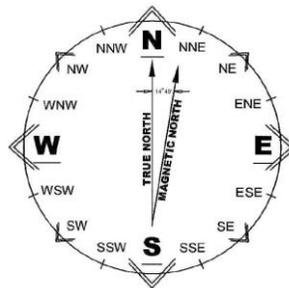

Chart B

On the following tree list **BLACK** marks are field notes and action items on trees that are to remain, and **RED** are trees that are recommended for removal. **Trees rated a 2 may be retained but only if the recommendations are followed**. **Blue** are trees which are not protected. Notes are explained further in the Discussion section of this report.

3545	NT	Interior Live Oak	<i>Quercus wislizenii</i>	1	9	20	Slight lean and unbalanced canopy to West, very sparse canopy	Remove dead wood, prune to balance	3

Level of Inspection, Testing and Analysis:

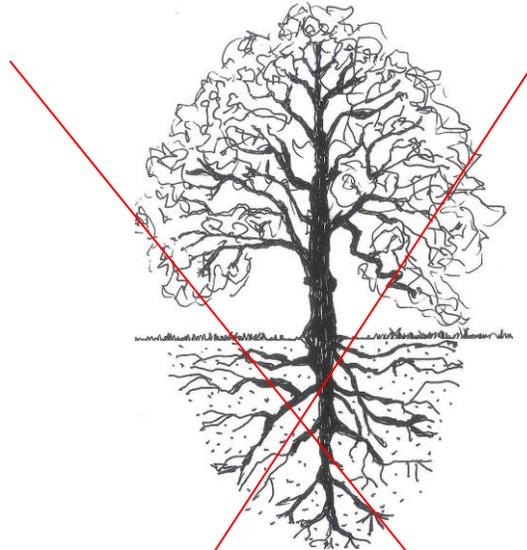

A Level 2 – Basic Visual Assessment was performed in accordance with the International Society of Arboriculture's best management practices. This assessment level is limited to the observation of conditions and defects which are readily visible. No laboratory or chemical testing and analysis was performed, only ground level observations.

A recommended Level 3 – Advanced Assessment should be performed on trees determined during the development process to have a target. Level 3 assessment includes aerial inspection

and evaluation of the structural defects of a tree including decay and load testing for purposes of risk analysis.

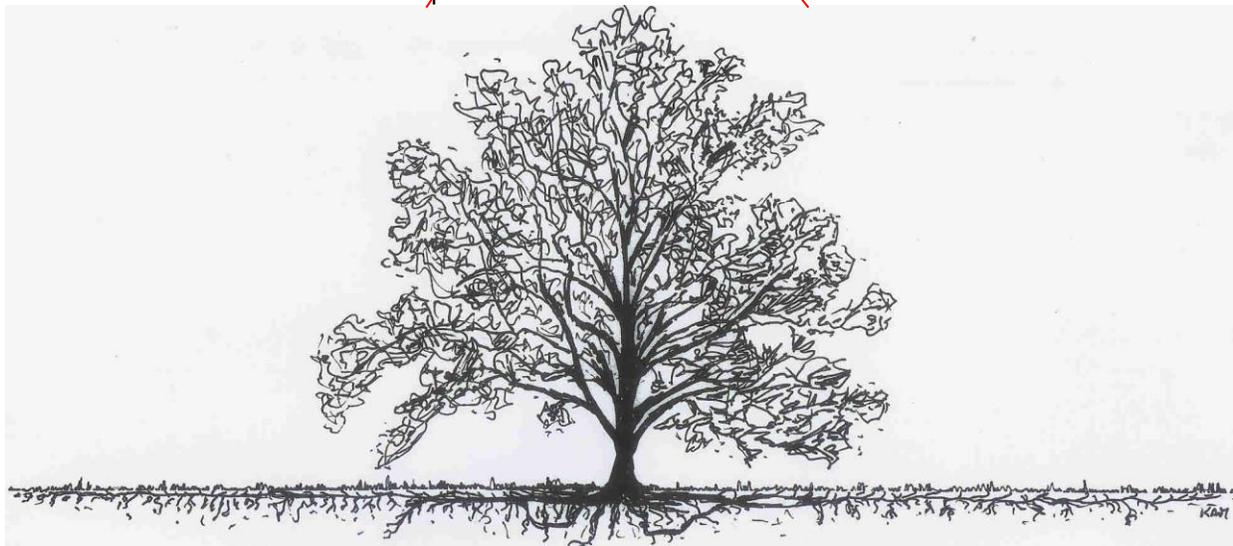

Discussion:

The majority of a tree’s roots are contained in a radius from the main trunk outward approximately two to three times the canopy of the tree. These roots are located in the top 6” to 3’ of soil. It is a common misconception that a tree underground resembles the canopy (see Drawing A below). The correct root structure of a tree is in Drawing B. All plants’ roots need both water and air for survival. Surface roots are a common phenomenon with trees grown in compacted soil. Poor canopy development or canopy decline in mature trees is often the result of inadequate root space and/or soil compaction.

Drawing A

Common misconception of where tree roots are assumed to be located

Drawing B

The reality of where roots are generally located

Healthy Canopy

Sparse Canopy

Epicormic growth is a trees response to loss of leave surface from either limb drop, over pruning, or stressful conditions. Epicormic growth is simply the release of latent buds, which begin rapid growth in order to provide as much new leaf surface in the shortest period of time to make up for the loss of leave surface. Epicormic growth prevents the death of the tree in stressful times, but creates a need for additional pruning. It is not the formation of a structurally intact new limb. The new limbs are weakly attached and need support and pruning.

Limited space for canopy development produces poor structure in trees. The largest tree in a given area, which is 'shading' the other trees is considered Dominant. The 'shaded' trees are considered Suppressed. The following picture illustrates this point. Suppressed trees are more likely to become a potential hazard due to their poor structure.

Dominant Tree

Growth is upright

Canopy is balanced by limbs and foliage equally

Suppressed Tree

Canopy weight all to one side

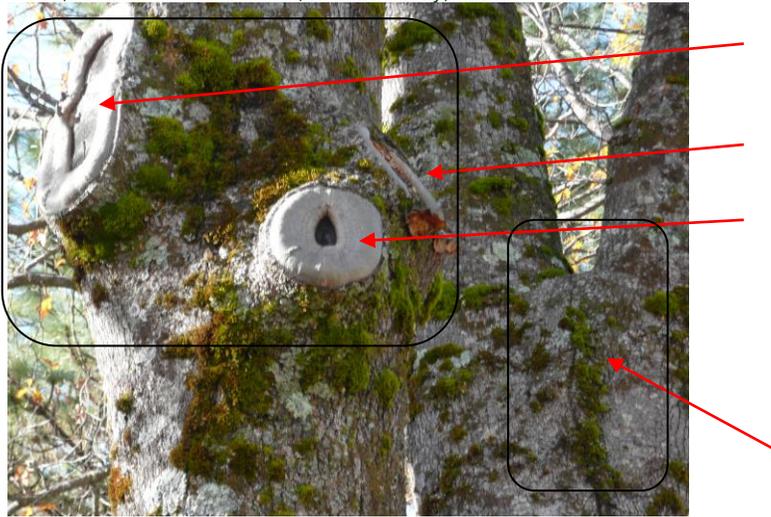

Limbs and foliage grow away from dominant tree

Pruning causes an open wound in the tree. Trees do not "heal" they compartmentalize. Any wound made today will always remain, but a healthy tree, in the absence of decay in the wound, will 'cover it' with callus tissue. Large, old pruning wounds with advanced decay are a likely failure point.

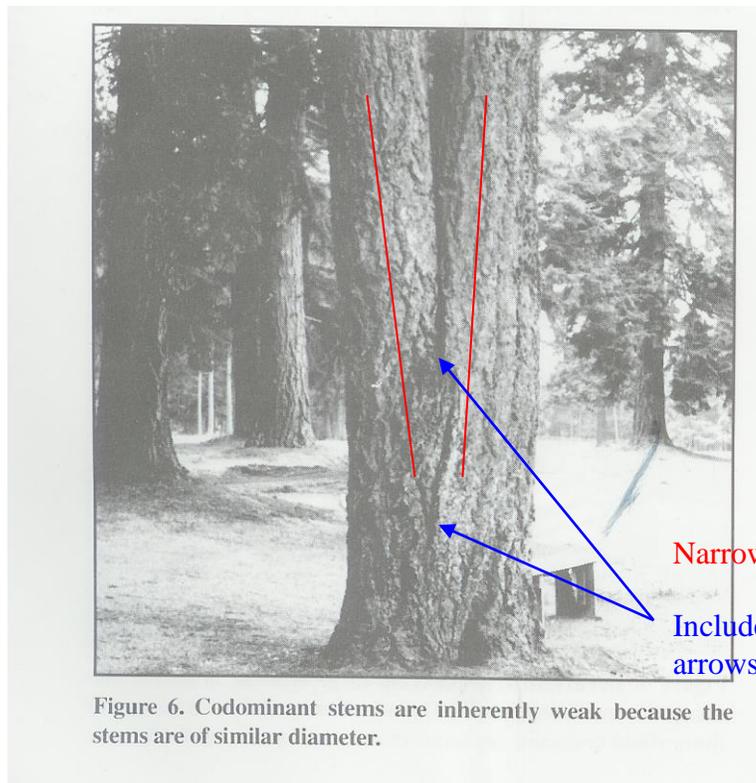

Two Potential Failure Points

Large pruning wound with callous, uneven surface as indication of decay

Large pruning wound with advanced decay

Co-dominant leaders are another common structural problem in trees.

The tree in this picture has a co-dominant leader at about 3' and included bark up to 7 or 8'. Included bark occurs when two or more limbs have a narrow angle of attachment resulting in bark between the stems – instead of cell to cell structure. This is considered a critical defect in trees and is the cause of many failures.

Narrow Angle

Included Bark between the arrows

Figure 6. Codominant stems are inherently weak because the stems are of similar diameter.

Photo from *Evaluation of Hazard Trees in Urban Areas* by Nelda P. Matheny and James R. Clark, 1994 International Society of Arboriculture

Leader #2 and foliage grown away from #1

In addition, co-dominant leaders phototropically (due to sunlight) suppress each other's growth. All the limbs are grown away from the main trunk to one side. The weight of the foliage of the tree is distributed asymmetrically placing a greater amount of pressure on the already

Weak union with the excessive weight of asymmetrical canopies

Our native oak trees are easily damaged or killed by having the soil within the Critical Root Zone (CRZ) disturbed or compacted. All of the work initially performed around protected trees that will be saved should be done by people rather than by wheeled or track type tractors. Oaks are fragile giants that can take little change in soil grade, compaction, or warm season watering. Don't be fooled into believing that warm season watering has no adverse effects on native oaks. Decline and eventual death can take as long as 5-20 years with poor care and inappropriate watering. Oaks can live hundreds of years if treated properly during construction, as well as later with proper pruning, and the appropriate landscape/irrigation design.

Conclusion:

A total of **431 oak** trees which met the Placer County Tree Preservation qualifications were tagged and evaluated. **ABACUS** has provided guidance for each of the trees in the form of the action column of Chart B, a discussions section, a specific recommendations section, a general recommendations section, and in the Tree Site Map at the end of this report.

- 1) **3** trees are rated a **0** ("dead") and should be removed immediately.
- 2) A total of **130** trees are rated **1** ("dangerous") and noted for immediate removal due to their poor condition.
- 3) There are **192** trees rated a **2** ("poor") and are noted for removal due to their poor condition. Trees in this category may be retained if all of the recommendations are followed to reduce risk.
- 4) **107** of the trees are rated **3** ("fair"), or **4** ("good").
- 5) There is **no** trees rated a **5** ("excellent").

There are **433** total trees inventoried, of which **2** are protected species but are too small for protection, **80** are Blue Oak, **25** are Valley Oak, and **324** are Interior Live Oak.

General Recommendations:

- 1) Follow all of the recommendations in the action column of [Chart B](#) immediately.
- 2) All trees to be saved shall have their root zones and trunk(s) protected with a four (4') foot high orange or yellow plastic, high visibility exclusionary fence surrounding the trees' root zone. The fence shall be staked 10' o.c. maximum spacing, with 5' steel "T" posts, 2" x 2" square or 2"+ \emptyset wood posts. The exclusionary area shall be under the tree's branched canopy and extend out to the tree's longest dripline radius plus one foot, as a circle. Where new construction will be within the Protected Root Zone, the fencing shall be 4' away from the footings, and extend around the rest of the canopy of the tree from that point. The fencing shall be maintained and not removed until the completion of construction. The fencing shall completely surround the Protected Root Zone and not be "U" shaped or open at any point. Whenever possible, include as many trees that are to be saved into one fenced exclusionary Protected Root Zone. The fencing plan will be completed once the developer decides on driveway, utility, and structure placement.
- 3) As soon as the concrete is poured and the forms are stripped, backfill the footings and stem walls. The protected trees nearby that are to remain should be watered to the point of soil saturation.
- 4) Care must also be continued after the construction is over to select the right plants to live under and near the native oaks. Watered lawns and any frequent summer watering near California oaks will not mix well over a long period. This will cause the oaks to perish due to *Armillaria mellea* (oak root fungus). The demise of the native oaks due to *Armillaria mellea* may take 5 – 20 years. Oaks should live 200 - 300 years.
- 5) To help control root damage, utility-trenching paths are to be established away from the roots and branches of the oaks that are to remain.
- 6) Soil compaction shall be avoided by maintaining the exclusionary Protected Root Zone fencing, keeping material storage, people, portable outhouses, vehicles, and dogs out of this area.
- 7) Soil contamination shall be avoided by eliminating chemical dumping on the property that may infiltrate into the Protected Root Zone. **No**: washing, dumping, or contaminating the site including but not necessarily limited to the following: concrete from tools or trucks, paint materials, sheetrock mud or stucco materials, other chemicals, solvents, herbicides, etc. Limestone gravel should not be used as base material or for drain rock as it will change the pH to be more alkaline, and may harm the native oaks.
- 8) Do not nail, tie, screw, or fasten any signs, braces, etc. to the trees that are to remain.
- 9) The cut and fill material excavated from or added to the lot can kill an oak by removing too many roots, drying or wetting the soil or by suffocating the roots with too much soil. Care must be taken with the added soil as well as with the actual excavation. Roots need air as much as they need water to survive and for the whole tree to live and to flourish. If fill material is needed, properly designed aeration/ventilation systems made to protect the trees and allow for the fill material can be installed.
- 10) When deciding on a pruning arborist, inquire about a chipper and require them to utilize the chipped branches of the trees to be removed or pruned. The chips are to be used under the oaks that are to remain, as mulch in the Protected Root Zone. Other mulch may be used of arborist type woodchips (4 – 6" deep), but not redwood or cedar bark.

11) When the recommended pruning is completed, it is only advisable if a qualified ISA Certified Arborist is on site. No cutting of live wood over 2"Ø shall be made. All cutting, pruning, trimming, cabling, guying, bracing, and lightning protection systems shall conform to the most current standards of the American National Standards Institute (ANSI). The current ANSI Tree Care Standards are A300 (Parts 1-4) 2000 to 2002 (copies at: www.ansi.org). The BMPs are "Best Management Practices", as companion publications to the ANSI Tree Care Standards, printed by the International Society of Arboriculture (copies at: www.isa-arbor.com). The BMP booklets explain the details of the ANSI Tree Care Standards and how to follow them correctly. Pruning of branches under 3" in diameter should be made with sharp hand tools: pruners, loppers, and/or handsaws, not chainsaws.

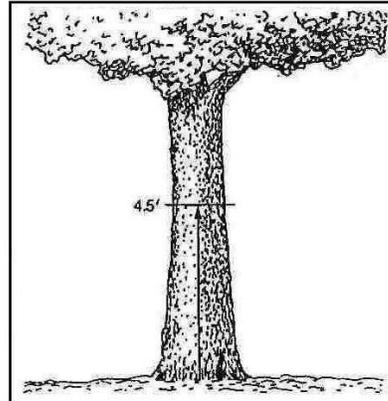

Following the recommendations of our report will greatly increase the likelihood of survival for all of the trees that will remain. Improving the aesthetics, decreasing maintenance costs, and most importantly reducing potential hazard and liability are the main goals.

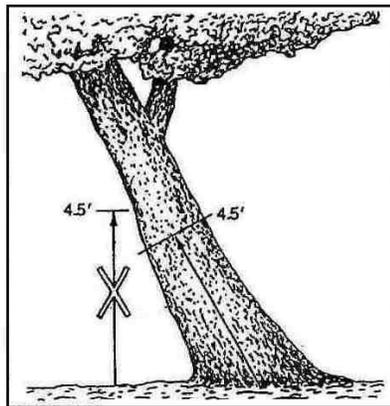

Tree SIZE Expressed by Trunk Diameter

"The height at which the trunk diameter of a tree is measured depends upon its size. The American Standard for Nursery Stock (ANSI, 1990) state that measurements shall be taken 6 inches (15 cm) above the ground for trunk diameters up to and including 4 inches (10 cm). Larger trees (assumed, but not stated, to be of transplantable size) are to be measured at 12 inches (30 cm). Trees normally considered too large to transplant are to be measured 4.5 feet [4'-6" is also called diameter breast high or dbh] (1.4 m) above the ground. Trees, like conifers, which have branches below 4.5 feet should be measured at a height that most effectively represents the size of the tree." The diameter is calculated by first measuring the circumference divided by 3.14 (π called pi) or by using a "diameter tape" whereon the inches are multiplied by π and shown to produce the diameter directly.

This is the dbh standard for measurement as shown in figure 4-2.

Figures 4-2. Trees with fairly straight, upright trunks with the lowest branch arising on the trunk higher than 6 feet (1.8 m) above the ground should be measured at 4.5 feet (1.4 m).

Figures 4-3 (top) and 4-4 (bottom). In each case, the trunk circumference should be measured at right angles to the trunk 4.5 feet (1.4 m) along the center of the trunk axis so the height is the average of the shortest and longest sides of the trunk.

There are some exceptions to the dbh standard as shown in the figures 4-3, 4-4, 4-5 & 4-6.

Figure 4-6. In a multi-stem tree, measure the trunk circumference of each trunk at 4.5 feet (1.4 m) above the ground. The area of each trunk is determined and then added together to obtain a trunk area that is representative of the size of the tree and each of the stems contribute its proportionate share to the canopy.

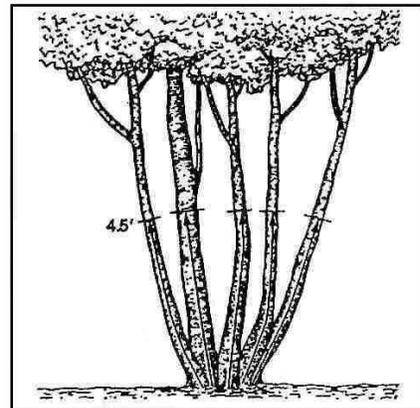

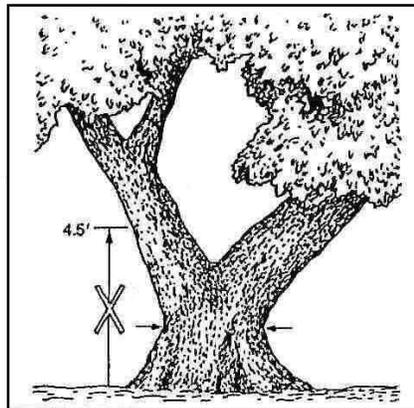

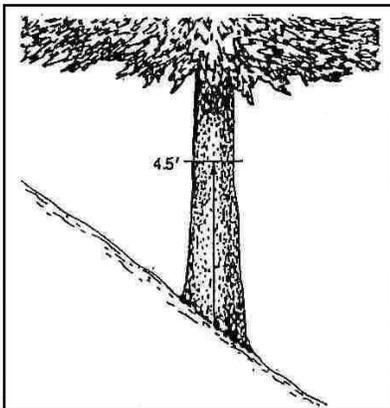

Figure 4-5. When low branches preclude measuring the trunk at 4.5 feet (1.4 m) measure the smallest circumference below the smallest branch. In this example, an alternative would be to determine the sum of the cross-sectional areas of the two stems measured about 12 inches (30 cm) above the crotch; then average the sum of the two branch areas and the smallest cross-sectional area below the branches. This may give a better estimate of tree size. Record the height of measurement(s) and the reasons the height or those heights were chosen.

Disclosure, Assumptions and Disclaimer

- 1) I, Nicole Harrison, ISA Certified Arborist WE-6500A, with “**ABACUS**”, did personally inspect the site and investigated the tree(s) as mentioned in this report and I performed all aspects of this report unless noted otherwise in the report.
- 2) I have neither financial interest in the tree work that may or may not be done, nor financial interest in the property where the tree(s) is (are) located unless noted within the report.
- 3) All opinions and recommendations expressed herein this report are mine solely. I have used my specialized education, knowledge, training and experience to examine the tree(s) and to make my opinions and recommendations to enhance the beauty, health and longevity, with an attempt to reduce the risk of who and/or what is near these trees. I cannot guarantee or warranty that a tree will not be healthy or safe under all circumstances, nor for a specific period of time or that problems may not arise in the future.
- 4) My report with its opinions and recommendations are limited to the tree(s) inspected.
- 5) I attempt to be cognizant of the whole scope of a project, but many matters are beyond the scope of my professional consulting arborist services such as: exact property boundaries, property ownership, site lines, easements, codes, covenants & restrictions (CC&Rs), disputed between neighbors, and other issues.
- 6) I rely on the information disclosed to me and assume the information to be complete, true, and accurate.
- 7) The inspection is limited to visual examination of accessible items of the tree(s), from the ground unless otherwise noted, without excavation, probing, boring, or dissection, unless noted otherwise. Only information covered in this report was examined, and reflects the condition of those inspected items at that specific time.
- 8) Clients may choose to accept or disregard these opinions and recommendations of the arborist or to seek additional advice.
- 9) This report is copyrighted. Any modification or partial use shall nullify the whole report. Do not copy without written permission. This report is for the client and the client’s assignees.
- 10) Sketches, diagrams, graphs, drawings, and photographs within this report are intended as visual aids and are not necessarily to scale, and should not be construed as engineering or architectural detail, reports or surveys.
- 11) I shall not attend or give a deposition and/or attend court by reason of this report unless fees are contracted for in advance, according to our standard fee schedule, adjusted yearly, for such services as described.

Executive Summary:

Jeff Glazner of Salix Consulting, Incorporated contracted **ABACUS** to evaluate and inventory the oak trees on the Creekside Oaks project site in Granite Bay, Placer County, California, and to produce the end product, an Arborist Report and Oak Tree Inventory.

ABACUS was on site from Tuesday, August 5th, 2014 to Tuesday, October 14, 2014; providing on-site tagging, identifications, number of trunks, DBH measurements, field condition notes, recommended actions, and ratings of the trees.

A total of **1044 oak** trees which met the Placer County Tree Preservation qualifications were tagged and evaluated. **ABACUS** has provided guidance for each of the trees in the form of the action column of **Chart B**, a discussions section, a specific recommendations section, a general recommendations section, and in the Tree Site Map at the end of this report.

- 1) **3** trees are rated a **0** (“dead”) and should be removed immediately.
- 2) A total of **132** trees are rated **1** (“dangerous”) and noted for immediate removal due to their poor condition.
- 3) There are **341** trees rated a **2** (“poor”) and are noted for removal due to their poor condition. Trees in this category may be retained if all of the recommendations are followed to reduce risk.
- 4) **567** of the trees are rated **3** (“fair”), or **4** (“good”).
- 5) There is **1** tree rated a **5** (“excellent”).

There are **1053** total trees inventoried, of which **9** are protected species but are too small for protection, **323** are Blue Oak, **21** are Valley Oak, and **700** are Interior Live Oak.

The community and Placer County want the trees protected by species and size and currently require the quality oak trees 6” dbh and greater to be protected at all times and accounted for **before** construction work has begun, and after completion. Our list of general recommendations and specific recommendations, as well as the action column in **Chart B**, listed in this report are required for protection of these trees.

Assignment:

Pursuant to your request, **ABACUS** has completed an inventory and evaluation of trees located within the development area; providing on-site tagging, as well as species identification, number of stems, DBH measurements, field condition notes, recommended actions, and ratings. The trees are located on Douglas Boulevard in Placer County, California.

Observations:

Nicole Harrison, ISA Certified Arborist #WE-6500AM-TRAQ, Joey Bena, ISA Certified Arborist #WE-10409A, Julie McNamara, Arborists Assistant, Michael McNamara, Arborists Assistant, and Nicholas McNamara, Arborists Assistant, inventoried, evaluated and tagged all trees that were 6" in diameter measured at 4-1/2' above ground level or at Diameter Breast Height (DBH). The fieldwork was completed Tuesday, August 5th, 2014 to Tuesday, October 14, 2014.

The protected trees (on-site) tagged by **ABACUS** have a numbered tag, placed on each one that is 1-1/8" x 1-3/8", green anodized aluminum, "acorn" shaped, and labeled: **ABACUS**, Auburn, CA with 1/8" pre-stamped tree number, our phone number 530-889-0603, attached with a natural colored aluminum 10d (3") nail, installed at 6 feet above ground level. The tag should last ~10 – 20+ years depending on the species before it is enveloped by the trees' normal growth cycle, as the tags are not nailed flush to the trunk.

The proposed development map and tree locations were provided by TSD Engineering. All of the other information regarding the trees within this report and on the Tree Site Map was by **ABACUS**.

Chart B in this report is an inventory on the protected trees. The following terms, and **Chart A** will further explain our findings on **Chart B** and the trees in question.

Species of trees is listed by our local and correct common name and botanical name by genus (capitalized) and species (lower case). Oaks frequently cross-pollinate and hybridize, but the identification is towards the strongest characteristics.

Stems refers to the quantity of trunks or stems of a tree that have a significant connection. If one stem or trunk were to be removed, it would cause decay to harm an adjoining stem, making it one tree. All stems must be of the same species. (Also see "Tree SIZE Expressed by Trunk Diameter" at the end of this report)

DBH (diameter breast high) is normally measured at 4'6" (above the average ground height for "Urban Forestry"), but if that varies then the location where it is measured is noted here. A Swedish caliper¹ was used to measure the DBH for trees less than 26" in diameter and a steel diameter tape² for trees greater than 26"Ø.

Rating is subjective to health and structure = condition. All of the trees were also rated for condition, per the recognized national standard as set up by the Council of Tree and Landscape Appraisers and the International Society of Arboriculture (ISA) on a numeric scale of 5 (being the highest) to zero (the worst condition, dead) as in **Chart A**. The rating was done in the field at the time of the measuring and inspection. The scale is as follows:

¹DBH or dbh, "Diameter Breast high" is the diameter of the tree's trunk in inches, measured 4' 6" off the ground (for more information see "Tree SIZE Expressed by Trunk Diameter" at the end of this report).

¹A large wooden sliding adjustable thickness gauge calibrated in 1/16" increments.

²Diameter Tape is used to figure the tree's diameter, by measuring the circumference, whereon the inches are pre-multiplied by 3.14 or π (π called pi) and shown to produce the diameter of the tree directly on the tape.

Chart A

No problem(s)	5	excellent
No apparent problem(s)	4	good
Minor problem(s)	3	fair
Major problem(s)	2	poor
Extreme problem(s)	1	hazardous or dangerous
Dead	0	dead

There is a very important line drawn between a tree rated a **3** and a **2**. A rating of **3 – 4 – 5** means that they are trees to be preserved and kept. A rating of a **0 – 1 – 2** is a tree that is recommended for removal and is a liability rather than an asset. On the following tree list **BLACK** marks are field notes and action items on trees that are to remain, and **RED** are trees that are recommended for removal. Trees rated a **2** may be retained but only if the recommendations are followed, otherwise the tree should be removed.

Rating #0: This indicates a tree that has no significant sign of life.

Rating #1: The problems are extreme. This rating is assigned to a tree that has structural and/or health problems that no amount of work or effort can change. The issues may or may not be considered a dangerous situation.

Rating #2: The tree has major problems. If the option is taken to preserve the tree, its condition could be improved with correct arboricultural work including, but not limited to: pruning, cabling, bracing, bolting, guying, spraying, mistletoe removal, vertical mulching, fertilization, etc. If the recommended actions are completed correctly, hazard can be reduced and the rating can be elevated to a 3. If no action is taken the tree is considered a liability and should be removed.

Rating #3: The tree is in fair condition. There are some minor structural or health problems that pose no immediate danger. When the recommended actions in an arborist report are completed correctly the defect(s) can be minimized or eliminated.

Rating #4: The tree is in good condition and there are no apparent problems that a Certified Arborist can see from a visual ground inspection. If potential structural or health problems are tended to at this stage future hazard can be reduced and more serious health problems can be averted.

Rating #5: No problems found from a visual ground inspection. Structurally, these trees have properly spaced branches and near perfect characteristics for the species. Highly rated trees are not common in natural or developed landscapes. No tree is ever perfect especially with the unpredictability of nature, but with this highest rating, the condition should be considered excellent.

Notes: explain why the tree should be removed or preserved. If it is to remain and be preserved the tree may need some form of work to limit future liability from partial or total failure. Lower deadwood may not be an immediate problem, but the same size wood at a much higher location on the trees could be dangerous and might cause a minor injury to a fatal blow if the branch failed.

Common Terms:

CDL: Co-Dominant Leader: Stems or trunks of the tree that are equal in size and relative importance.

NAA: Narrow Attachment: A sharp “V” crotch, usually less than a 45° angle of attachment. Included bark is explained above and is common in branches with narrow attachments. In addition, these branches may not be attached to the trunk as well as others with wider angles of attachment, and can fail more frequently depending on the size of the branch.

TBR: To Be Removed: Tree to be removed due to health and/or structural reasons. Removal should be done carefully as to not harm the surrounding trees, branches, and/or trunks above or roots below ground. Do NOT rip out or push over the tree stumps if they are near other trees that are to be preserved. Cut them off close to ground level and leave the stumps and roots to decay, unless they are located within a proposed foundation or area to be paved/concrete surfaced.

UC: Unbalanced Canopy: Either the trunk is leaning and/or the canopy is phototropic and overly heavy on one side.

Compass Points: These are the standard 16 points of the compass as aligned with Geographic North or True North. In our area, True North (TN) is adjusted for declination 14°49’ to the west of Magnetic North (MN).

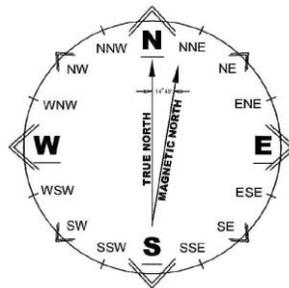

Chart B

On the following tree list **BLACK** marks are field notes and action items on trees that are to remain, and **RED** are trees that are recommended for removal. **Trees rated a 2 may be retained but only if the recommendations are followed**. **Blue** are trees which are not protected. Notes are explained further in the Discussion section of this report.

<u>Tree #</u>	<u>Old Tree #</u>	<u>Common Name</u>	<u>Botanical Name</u>	<u>Stems</u>	<u>DBH</u>	<u>Canopy</u>	<u>Notes</u>	<u>Action</u>	<u>Rating</u>

Level of Inspection, Testing and Analysis:

A Level 2 – Basic Visual Assessment was performed in accordance with the International Society of Arboriculture’s best management practices. This assessment level is limited to the observation of conditions and defects which are readily visible. No laboratory or chemical testing and analysis was performed, only ground level observations.

A recommended Level 3 – Advanced Assessment should be performed on trees determined during the development process to have a target. Level 3 assessment includes aerial inspection and evaluation of the structural defects of a tree including decay and load testing for purposes of risk analysis.

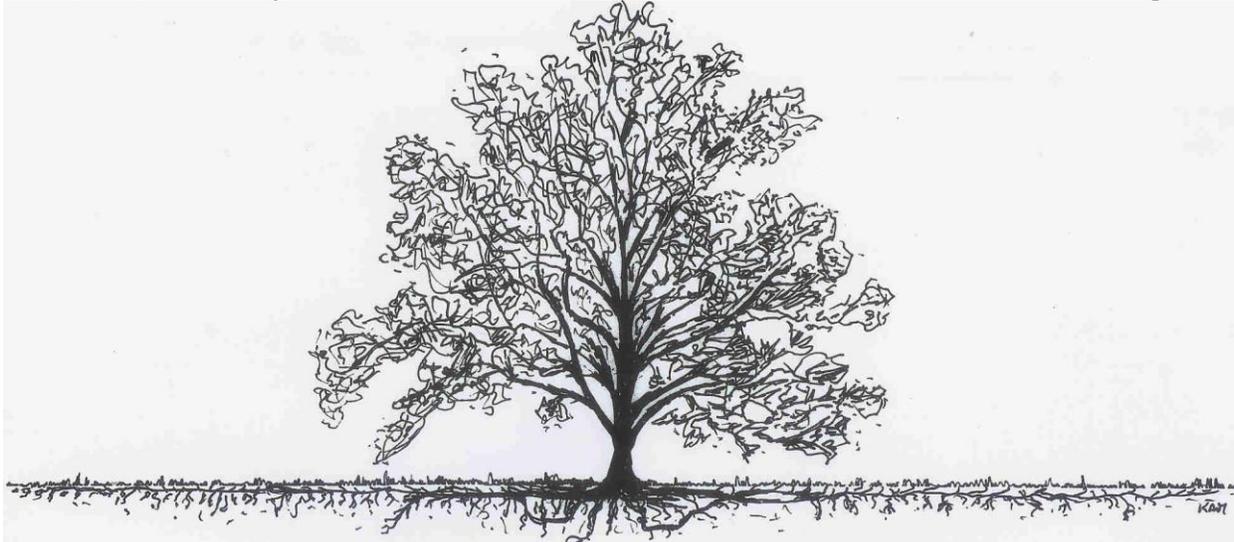

Discussion:

The majority of a tree’s roots are contained in a radius from the main trunk outward approximately two to three times the canopy of the tree. These roots are located in the top 6” to 3’ of soil. It is a common misconception that a tree underground resembles the canopy (see Drawing A below). The correct root structure of a tree is in Drawing B. All plants’ roots need both water and air for survival. Surface roots are a common phenomenon with trees grown in compacted soil. Poor canopy development or canopy decline in mature trees is often the result of inadequate root space and/or soil compaction.

Drawing A

Common misconception of where tree roots are assumed to be located

Drawing B

The reality of where roots are generally located

Healthy Canopy

Sparse Canopy

Photo by Nicole Harrison

Epicormic growth is a trees response to loss of leaf surface from either limb drop, over pruning, or stressful conditions. Epicormic growth is simply the release of latent buds, which begin rapid growth in order to provide as much new leaf surface in the shortest period of time to make up for the loss of leaf surface. Epicormic growth prevents the death of the tree in stressful times, but creates a need for additional pruning. It is not the formation of a structurally intact new limb. The new limbs are weakly attached and need support and pruning.

Limited space for canopy development produces poor structure in trees. The largest tree in a given area, which is 'shading' the other trees is considered Dominant. The 'shaded' trees are considered Suppressed. The following picture illustrates this point. Suppressed trees are more likely to become a potential hazard due to their poor structure.

Dominant Tree

Growth is upright

Canopy is balanced by limbs and foliage equally

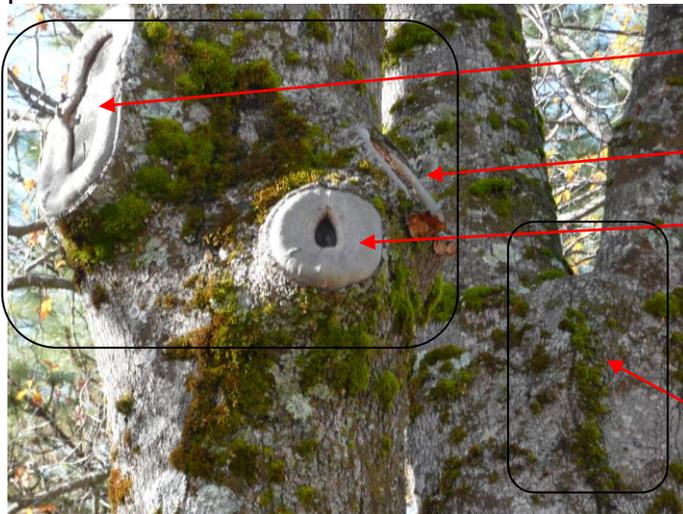

Suppressed Tree

Canopy weight all to one side

Limbs and foliage grow away from dominant tree

Pruning causes an open wound in the tree. Trees do not “heal” they compartmentalize. Any wound made today will always remain, but a healthy tree, in the absence of decay in the wound, will ‘cover it’ with callus tissue. Large, old pruning wounds with advanced decay are a likely failure point.

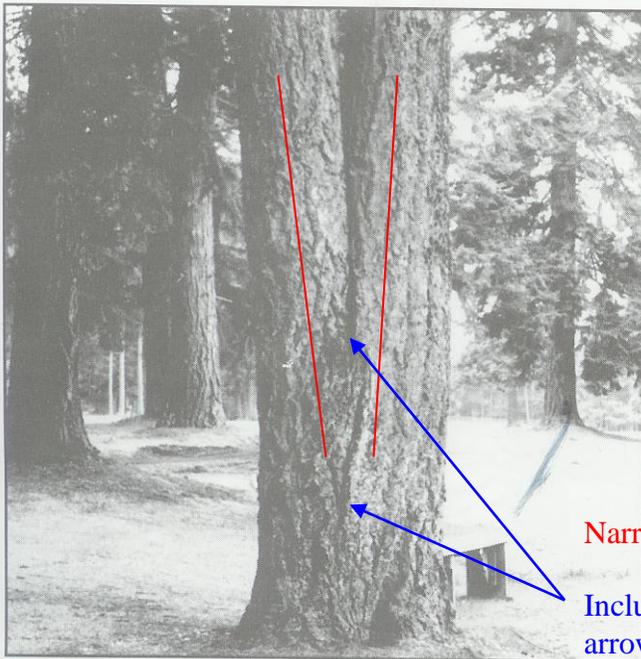

Two Potential Failure Points

Large pruning wound with callous, uneven surface as indication of decay

Large pruning wound with advanced decay

Smaller pruning wound almost covered, black color could be an indication of decay

Co-dominant leaders are another common structural problem in trees.

The tree in this picture has a co-dominant leader at about 3' and included bark up to 7 or 8'. Included bark occurs when two or more limbs have a narrow angle of attachment resulting in bark between the stems – instead of cell to cell structure. This is considered a critical defect in trees and is the cause of many failures.

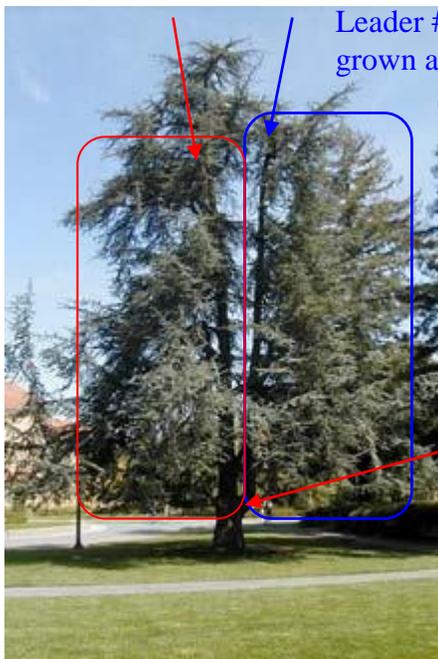

Narrow Angle

Included Bark between the arrows

Figure 6. Codominant stems are inherently weak because the stems are of similar diameter.

Photo from Evaluation of Hazard Trees in Urban Areas by Nelda P. Matheny and James R. Clark, 1994 International Society of Arboriculture

Leader #1

In addition, co-dominant leaders phototropically (due to sunlight) suppress each other's growth. All the limbs are grown away from the main trunk to one side. The weight of the foliage of the tree is distributed asymmetrically placing a greater amount of pressure on the already weak union.

Weak union with the excessive weight of asymmetrical canopies

Photo from <http://grounds.stanford.edu/points/significanttrees/cedrusatlantica.html>

Our native oak trees are easily damaged or killed by having the soil within the Critical Root Zone (CRZ) disturbed or compacted. All of the work initially performed around protected trees that will be saved should be done by people rather than by wheeled or track type tractors. Oaks are fragile giants that can take little change in soil grade, compaction, or warm season watering. Don't be fooled into believing that warm season watering has no adverse effects on native oaks. Decline and eventual death can take as long as 5-20 years with poor care and inappropriate watering. Oaks can live hundreds of years if treated properly during construction, as well as later with proper pruning, and the appropriate landscape/irrigation design.

Conclusion:

A total of **1044 oak** trees which met the Placer County Tree Preservation qualifications were tagged and evaluated. **ABACUS** has provided guidance for each of the trees in the form of the action column of Chart B, a discussions section, a specific recommendations section, a general recommendations section, and in the Tree Site Map at the end of this report.

- 1) **3** trees are rated a **0** ("dead") and should be removed immediately.
- 2) A total of **132** trees are rated **1** ("dangerous") and noted for immediate removal due to their poor condition.
- 3) There are **341** trees rated a **2** ("poor") and are noted for removal due to their poor condition. Trees in this category may be retained if all of the recommendations are followed to reduce risk.
- 4) **567** of the trees are rated **3** ("fair"), or **4** ("good").
- 5) There is **1** tree rated a **5** ("excellent").

There are **1053** total trees inventoried, of which **9** are protected species but are too small for protection, **323** are Blue Oak, **21** are Valley Oak, and **700** are Interior Live Oak.

General Recommendations:

- 1) Follow all of the recommendations in the action column of Chart B immediately.
- 2) All trees to be saved shall have their root zones and trunk(s) protected with a four (4') foot high orange or yellow plastic, high visibility exclusionary fence surrounding the trees' root zone. The fence shall be staked 10' o.c. maximum spacing, with 5' steel "T" posts, 2" x 2" square or 2"+ \emptyset wood posts. The exclusionary area shall be under the tree's branched canopy and extend out to the tree's longest dripline radius plus one foot, as a circle. Where new construction will be within the Protected Root Zone, the fencing shall be 4' away from the footings, and extend around the rest of the canopy of the tree from that point. The fencing shall be maintained and not removed until the completion of construction. The fencing shall completely surround the Protected Root Zone and not be "U" shaped or open at any point. Whenever possible, include as many trees that are to be saved into one fenced exclusionary Protected Root Zone. The fencing plan will be completed once the developer decides on driveway, utility, and structure placement.
- 3) As soon as the concrete is poured and the forms are stripped, backfill the footings and stem walls. The protected trees nearby that are to remain should be watered to the point of soil saturation.
- 4) Care must also be continued after the construction is over to select the right plants to live under and near the native oaks. Watered lawns and any frequent summer watering near California oaks will not mix well over a long period. This will cause the oaks to perish due to *Armillaria mellea* (oak

root fungus). The demise of the native oaks due to *Armillaria mellea* may take 5 – 20 years. Oaks should live 200 - 300 years.

- 5) To help control root damage, utility-trenching paths are to be established away from the roots and branches of the oaks that are to remain.
- 6) Soil compaction shall be avoided by maintaining the exclusionary Protected Root Zone fencing, keeping material storage, people, portable outhouses, vehicles, and dogs out of this area.
- 7) Soil contamination shall be avoided by eliminating chemical dumping on the property that may infiltrate into the Protected Root Zone. **No**: washing, dumping, or contaminating the site including but not necessarily limited to the following: concrete from tools or trucks, paint materials, sheetrock mud or stucco materials, other chemicals, solvents, herbicides, etc. Limestone gravel should not be used as base material or for drain rock as it will change the pH to be more alkaline, and may harm the native oaks.
- 8) Do not nail, tie, screw, or fasten any signs, braces, etc. to the trees that are to remain.
- 9) The cut and fill material excavated from or added to the lot can kill an oak by removing too many roots, drying or wetting the soil or by suffocating the roots with too much soil. Care must be taken with the added soil as well as with the actual excavation. Roots need air as much as they need water to survive and for the whole tree to live and to flourish. If fill material is needed, properly designed aeration/ventilation systems made to protect the trees and allow for the fill material can be installed.
- 10) When deciding on a pruning arborist, inquire about a chipper and require them to utilize the chipped branches of the trees to be removed or pruned. The chips are to be used under the oaks that are to remain, as mulch in the Protected Root Zone. Other mulch may be used of arborist type woodchips (4 – 6" deep), but not redwood or cedar bark.
- 11) When the recommended pruning is completed, it is only advisable if a qualified ISA Certified Arborist is on site. No cutting of live wood over 2"Ø shall be made. All cutting, pruning, trimming, cabling, guying, bracing, and lightning protection systems shall conform to the most current standards of the American National Standards Institute (ANSI). The current ANSI Tree Care Standards are A300 (Parts 1-4) 2000 to 2002 (copies at: www.ansi.org). The BMPs are "Best Management Practices", as companion publications to the ANSI Tree Care Standards, printed by the International Society of Arboriculture (copies at: www.isa-arbor.com). The BMP booklets explain the details of the ANSI Tree Care Standards and how to follow them correctly. Pruning of branches under 3" in diameter should be made with sharp hand tools: pruners, loppers, and/or handsaws, not chainsaws.

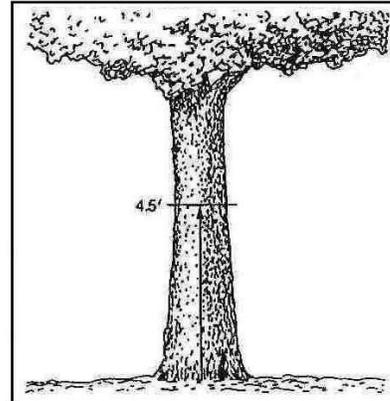

Following the recommendations of our report will greatly increase the likelihood of survival for all of the trees that will remain. Improving the aesthetics, decreasing maintenance costs, and most importantly reducing potential hazard and liability are the main goals.

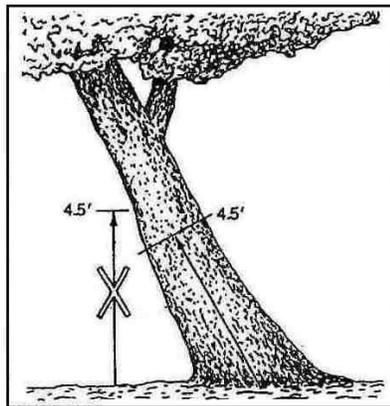

Tree SIZE Expressed by Trunk Diameter

"The height at which the trunk diameter of a tree is measured depends upon its size. The American Standard for Nursery Stock (ANSI, 1990) state that measurements shall be taken 6 inches (15 cm) above the ground for trunk diameters up to and including 4 inches (10 cm). Larger trees (assumed, but not stated, to be of transplantable size) are to be measured at 12 inches (30 cm). Trees normally considered too large to transplant are to be measured 4.5 feet [4'-6" is also called diameter breast high or dbh] (1.4 m) above the ground. Trees, like conifers, which have branches below 4.5 feet should be measured at a height that most effectively represents the size of the tree." The diameter is calculated by first measuring the circumference divided by 3.14 (π called pi) or by using a "diameter tape" whereon the inches are multiplied by π and shown to produce the diameter directly.

This is the dbh standard for measurement as shown in figure 4-2.

Figures 4-2. Trees with fairly straight, upright trunks with the lowest branch arising on the trunk higher than 6 feet (1.8 m) above the ground should be measured at 4.5 feet (1.4 m).

Figures 4-3 (top) and 4-4 (bottom). In each case, the trunk circumference should be measured at right angles to the trunk 4.5 feet (1.4 m) along the center of the trunk axis so the height is the average of the shortest and longest sides of the trunk.

There are some exceptions to the dbh standard as shown in the figures 4-3, 4-4, 4-5 & 4-6.

Figure 4-6. In a multi-stem tree, measure the trunk circumference of each trunk at 4.5 feet (1.4 m) above the ground. The area of each trunk is determined and then added together to obtain a trunk area that is representative of the size of the tree and each of the stems contribute its proportionate share to the canopy.

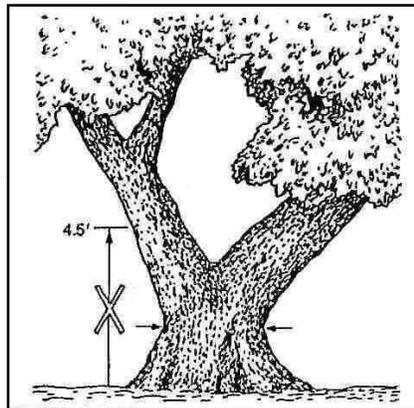

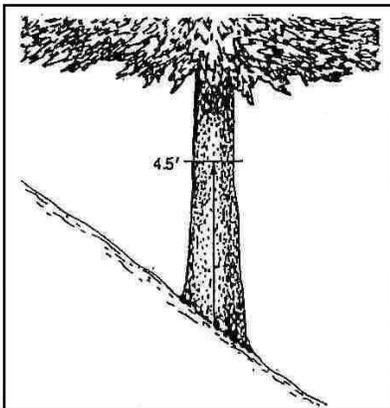

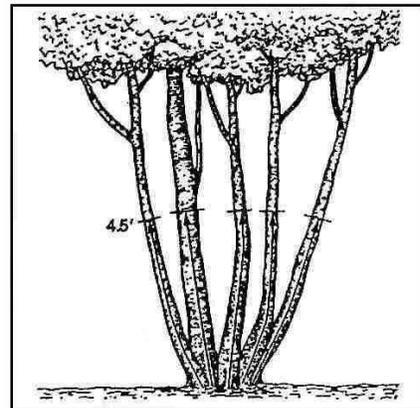

Figure 4-5. When low branches preclude measuring the trunk at 4.5 feet (1.4 m) measure the smallest circumference below the smallest branch. In this example, an alternative would be to determine the sum of the cross-sectional areas of the two stems measured about 12 inches (30 cm) above the crotch; then average the sum of the two branch areas and the smallest cross-sectional area below the branches. This may give a better estimate of tree size. Record the height of measurement(s) and the reasons the height or those heights were chosen.

RE: Whitehawk II Project Rare Plant Survey

Dear Mr. Wilson:

Salix Consulting conducted a rare plant surveys at the ±33-acre Whitehawk II (a.k.a Creekside Oaks, Granite Bay 33) Study Area (study area) located in the community of Granite Bay, Placer County, California. The study area is located just west of Quartzite Circle, between Douglas Boulevard and Eureka Road, in the western portion of Granite Bay. It is situated in Section 9, Township 10 North and Range 7 East on the Folsom, California 7.5-minute USGS topographic quadrangle (Figure 1). The approximate coordinates for the center of the property are: 38°44' 31" N and 121°12' 40" W.

The site occurs at the lower edge of the western foothills of the Sierra Nevada at elevation ranging between 255 and 295 feet. The study area supports mostly foothill woodland, and topography is highly variable due to the presence of historic dredge tailings throughout the site. Strap Ravine, a regionally-intermittent stream, runs in a westerly direction through the northern portion of the site. The study area is surrounded by rural residential on three sides and Douglas Boulevard and higher density development to the north (Figure 2).

The database queries and off-season analysis conducted for the *Creekside Oaks Study Area Biological and Wetlands Resources Assessment* (Assessment) determined that marginal habitat for big-scale balsamroot (*Balsamorhiza macrolepis* var. *macrolepis*) and Sanford's arrowhead (*Sagittaria sanfordii*), both ranked 1B by the California Native Plant Society (CNPS), was present within the region of the study area. Figure 3 illustrates special-status plant species occurrences within a 5-mile radius of the study area. This rare plant survey was conducted to determine the species' presence or absence on the site.

Big-scale balsamroot was considered "unlikely" to occur due to the presence of only marginal quality habitat. Big-scale balsamroot is an herbaceous perennial member of the sunflower family (Asteraceae). It has no state or federal status. This species has large yellow flowering heads and leaves that arise from the ground. It differs, in part, from other balsamroots by having coarsely serrate leaves. Big-scale balsam-root grows in open woodlands and grasslands at widely scattered locations in Northern California. It blooms from March to June.

No members of the genus *Balsamorhiza* or similar genus *Wyethia*, were observed during previously conducted field assessments. The nearest recorded occurrence of big-scale balsam-root is from approximately 6 to 7 miles northwest of the site just west of Highway 65, between Roseville and Lincoln.

Sanford's arrowhead is an herbaceous perennial member of the water-plantain family (Alismataceae). It has no state or federal status. Preferred habitat includes marshes associated with slow-moving water in sloughs and ditches. It is also known to occur in concrete-lined channels with only a few inches of soil. It has a long blooming period, starting as early as May and occasionally lasting through September.

No individuals of *Sagittaria* were observed during previous field assessments. The closest recorded occurrence of this species is from approximately 3 to 4 miles to the southwest in the Citrus Heights area (CNDDDB 2014). This species was documented at this location in 1997 in a cattail-dominated freshwater marsh.

METHODS

Field surveys were conducted on the site on April 20, May 1, and May 20, 2015 by Jeff Glazner and Barry Anderson. The timing of the surveys was selected to coincide with the blooming period of most springtime species, including, big-scale balsamroot and Sanford's arrowhead. The surveys were floristic in nature with the goal of identifying species observed to the taxonomic level necessary to determine if it was a special-status species or not. Most common species in the various areas of the site were identified. A list of all plant species observed is included with this report (Appendix A).

RESULTS

Biological Communities

The study area is comprised mostly of foothill woodland (including embedded cottonwood stands), riparian woodland, wetlands, and less than an acre of Strap Ravine. Biological communities are illustrated in Figure 4, and representative site photos are presented in Figure 5.

Foothill Woodland

Foothill Woodland is the primary habitat type within the Creekside Oaks study area, occupying approximately 27 acres. Tree cover is variable throughout the site, ranging from dense to sparse. The majority of the acreage has high canopy cover. An area along the southern boundary and an area in the western middle of the site are the open canopied areas. The most abundant trees within foothill woodland include interior live oak (*Quercus wislizeni*), blue oak (*Quercus douglasii*), and gray pine (*Pinus sabiniana*).

Understory shrubs include poison oak (*Toxicodendron diversilobum*), coyote brush (*Baccharis pilularis*), buckbrush (*Ceanothus cuneatus*), buckeye (*Aesculus californica*), toyon (*Heteromoles arbutifolia*), hoary coffeeberry (*Frangula californica*), Himalayan blackberry (*Rubus armeniacus*), and California blackberry (*Rubus ursinus*). Common herbaceous species within the understory include field hedge parsley (*Torillis arvensis*), Italian thistle (*Carduus pycnocephalus*), yellow star thistle (*Centaurea solstitialis*), skeleton weed (*Chondrilla juncea*), bindweed (*Convolvulus arvensis*), broad-leaf filaree (*Erodium botrys*), soft chess (*Bromus hordeaceus*), hedgehog dogtail (*Cynosurus echinatus*), soap plant (*Chlorogalum pomderidianum*), turkey mullein (*Croton setigerus*), Klamathweed (*Hypericum perforatum*), rose clover (*Trifolium hirtum*), spanish clover (*Acmispon americanus*), vetch (*Vicia sp.*), wild oat (*Avena*

fatua), and ripgut grass (*Bromus diandrus*).

Approximately six (6) acres of mature Fremont cottonwood (*Populus fremontii*) stands occur in the southern half of the site as part of the foothill woodland. These areas correspond to historic placer mining and disrupted local hydrology.

A few willows including red willow (*Salix laevigata*) occur within the study area, often in association with the cottonwoods. These willows are generally restricted to lower-elevation areas scattered throughout the dredge tailings and occur as part of the foothill woodland community.

Riparian Woodland

Within the study area, approximately three (3) acres of riparian woodland occur in a fairly consistent width along the Strap Ravine channel. Canopy species include Fremont cottonwoods, Gooding's willow (*Salix gooddingii*), red willow (*Salix laevigata*), sandbar willow (*Salix exigua*) and valley oak. Himalayan blackberry is the most common understory species and occurs in dense thickets along many reaches.

Wetlands and Strap Ravine

Wetlands occupy approximately three (3) acres of the project site. Common species include broad-leaved cattail (*Typha latifolia*), spikerush (*Eleocharis pachycarpa*), Mexican rush (*Juncus mexicanus*), iris-leaf rush (*Juncus xiphioides*), clustered field-sedge (*Carex praegracilis*), and cocklebur (*Xanthium strumarium*). The overstory commonly includes mature cottonwoods and other typical foothill woodland species.

Strap Ravine is a seasonal (intermittent) stream. The reach of Strap Ravine that runs through the study area is characterized as a relatively shallow channel, is 5 to 15 feet wide, and is bounded on both sides by blackberry, willow, cottonwood and oaks. Water was flowing at a very low rate during the surveys.

CONCLUSION

Salix Consulting conducted rare plant surveys of the Whitehawk II study area in Granite Bay, CA. The three surveys were timed to determine the presence or absence of big-scale balsamroot and Sanford's arrowhead. Neither these two target special-status species, nor any others, were observed within the study area. In our opinion, the Whitehawk II study area does not support any special-status plant species.

Thank you for the opportunity to conduct this survey. Please contact me if you have any questions regarding the survey results.

Sincerely,

Jeff Glazner
Principal Biologist

RE: Whitehawk I Project Rare Plant Survey

Dear Mr. Wilson:

At your request, Salix Consulting conducted a rare plant surveys at the ±17-acre Whitehawk I (a.k.a. Beaver Creek, Granite Bay 17) Study Area (study area) located in the community of Granite Bay, Placer County, California. The study area is located on the south side of Douglas Boulevard, just east of Sierra College Boulevard and Woodgrove Way. It is situated in Section 9, Township 10 North and Range 7 East on the Folsom, California 7.5-minute USGS topographic quadrangle (Figure 1). The approximate latitude and longitude for the center of the property are: 38°44' 31" N and 121°13' 00" W.

The site occurs at the lower edge of the western foothills of the Sierra Nevada at approximately 270 feet. The study area supports mostly foothill woodland and topography is highly variable due to the presence of historic dredge tailings throughout the site. Strap Ravine, a regionally intermittent stream, bisects the property and flows in a west and southwesterly direction. The study area is surrounded by newer residential subdivisions, rural residential properties, and undeveloped properties (Figure 2).

The database queries and site analysis conducted for the December 2014 *Beaver Creek Study Area Biological and Wetlands Resources Assessment (BRA)* determined that marginal habitat for big-scale balsamroot (*Balsamorhiza macrolepis* var. *macrolepis*) and Sanford's arrowhead (*Sagittaria sanfordii*), both ranked 1B by the California Native Plant Society (CNPS), was present within the study area, but surveys had been conducted for the Assessment after the bloom period for the species. This rare plant survey was conducted to determine the species' presence or absence on the site. Figure 3 illustrates special-status plant species occurrences within a 5-mile radius of the study area.

Big-scale balsamroot was considered "unlikely" to occur due to the presence of only marginal quality habitat. Big-scale balsamroot is an herbaceous perennial member of the sunflower family (Asteraceae). It has no state or federal status. This species has large yellow flowering heads and leaves that arise from the ground. It differs, in part, from other balsamroots by having coarsely serrate leaves. Big-scale balsam-root grows in open

woodlands and grasslands at widely scattered locations in Northern California. It blooms from March to June.

No members of the genus *Balsamorhiza* or similar genus *Wyethia*, were observed during field assessments conducted in 2004 and 2014. The nearest recorded occurrence of big-scale balsam-root is from approximately 6 to 7 miles northwest of the site just west of Highway 65, between Roseville and Lincoln.

Sanford's arrowhead is an herbaceous perennial member of the water-plantain family (Alismataceae). It has no state or federal status. Preferred habitat includes marshes associated with slow-moving water in sloughs and ditches. It is also known to occur in concrete lined channels with only a few inches of soil. It has a long blooming period, starting as early as May and occasionally lasting through September.

No individuals of *Sagittaria* were observed during the 2014 field assessment however, northern water plantain (*Alisma triviale*) does grow in Strap Ravine. Northern water plantain is similar to Sanford's arrowhead and grows in similar habitats. The closest recorded occurrence of Sanford's arrowhead is from approximately 4 miles to the southwest in the Citrus Heights area (CNDDDB 2014). This species was documented at this location in 1997 in a cattail-dominated freshwater marsh.

METHODS

Two surveys were conducted on the site on April 20, 2015 and May 20, 2015 by Jeff Glazner and Barry Anderson. All areas of the site were walked with particular attention paid to the suitable habitat areas. To the extent possible, the creek thread was walked because of the suitable habitat for Sanford's arrowhead. The timing of the surveys was selected to coincide with the blooming period of most springtime species, and in particular, big-scale balsamroot and Sanford's arrowhead. The surveys were floristic in nature with the goal of identifying species observed to the taxonomic level necessary to determine if it was a special-status species or not. Most species in the various areas of the site were identified and are presented with this report as Appendix A.

RESULTS

Biological Communities

The study area is comprised mostly of foothill woodland (including embedded cottonwood stands), riparian woodland, wetlands and less than an acre of Strap Ravine. Biological communities are illustrated in Figure 4, and representative site photos are presented in Figure 5.

Foothill Woodland

Foothill woodland is the primary habitat type within the Beaver Creek study area, occupying approximately 13 acres of the site. Tree cover is variable throughout the site, and tree density is highest in the central and southeastern portions of the property, generally in areas near Strap Ravine. The dominant trees within foothill woodland include interior live

oak (*Quercus wislizeni*) and blue oak (*Quercus douglasii*). Valley oak (*Quercus lobata*) and foothill pine (*Pinus sabiniana*) are also common components across the study area.

The shrub layer includes poison oak (*Toxicodendron diversilobum*), coyote brush (*Baccharis pilularis*), toyon (*Heteromeles arbutifolia*), buckbrush (*Ceanothus cuneatus*), Himalayan blackberry (*Rubus armeniacus*), oak saplings, and an occasional olive tree (*Olea europaea*). Common herbaceous species within the understory include field hedge parsley (*Torilis arvensis*), Italian thistle (*Carduus pycnocephalus*), yellow star thistle (*Centaurea solstitialis*), Italian rye grass (*Festuca perennis*), hedgehog dogtail (*Cynosurus echinatus*), soap plant (*Chlorogalum pomderidianum*), vetch (*Vicia* spp.), wild oat (*Avena fatua*), and ripgut grass (*Bromus diandrus*).

Approximately one acre of mature Fremont cottonwood (*Populus fremontii*) stands are included in the foothill woodland habitat in the southeastern portion of the study area and are associated with historic placer mining.

Riparian Woodland

Within the study area, approximately three acres of riparian woodland occurs in association with Strap Ravine and consists of a mixed overstory of mature Fremont cottonwoods, Gooding's willow (*Salix gooddingii*), red willow (*Salix laevigata*), and some oak trees. This habitat type occurs in the central portion of the site and covers approximately 3 acres. Some areas along Strap Ravine have been heavily influenced by historic placer-mining and the understory is highly variable. Himalayan blackberry is a common understory species and occurs in dense thickets in many locations. In some reaches adjacent to the channel, wide fringe wetlands support herbaceous marsh species including cocklebur (*Xanthium strumarium*), willow weed (*Persicaria lapathifolia*), water plantain (*Alisma triviale*), broad-leaved cattail (*Typha latifolia*), and black sand spikerush (*Eleocharis pachycarpa*). Moisture persists in the fringe wetlands well into the dry season.

Wetlands and Strap Ravine

The Strap Ravine channel is surrounded by a dense canopy of riparian species including Fremont cottonwood and several willows. Himalayan blackberry is the primary understory species in the woodland.

Wetlands occur on the site in several forms: wetland swale, seasonal wetland, and seasonal marsh. Wetland vegetation on the site consists of various species of rush, tall flatsedge (*Cyperus eragrostis*), water plantain, broad-leaved cattail, and hairy willowherb (*Epilobium ciliatum*). Himalayan blackberry is a common component in the Strap Ravine corridor.

CONCLUSION

Salix Consulting conducted a rare plant survey of the Whitehawk I study area in Granite Bay, CA. The two seasonal surveys were timed to determine the presence or absence of big-scale balsamroot and Sanford's arrowhead. Neither these two target special-status species, nor any others, were observed within the study area. In our opinion, the Whitehawk I study area does not support any special-status plant species.

Should you need any additional information, please contact me at any time.

Sincerely,

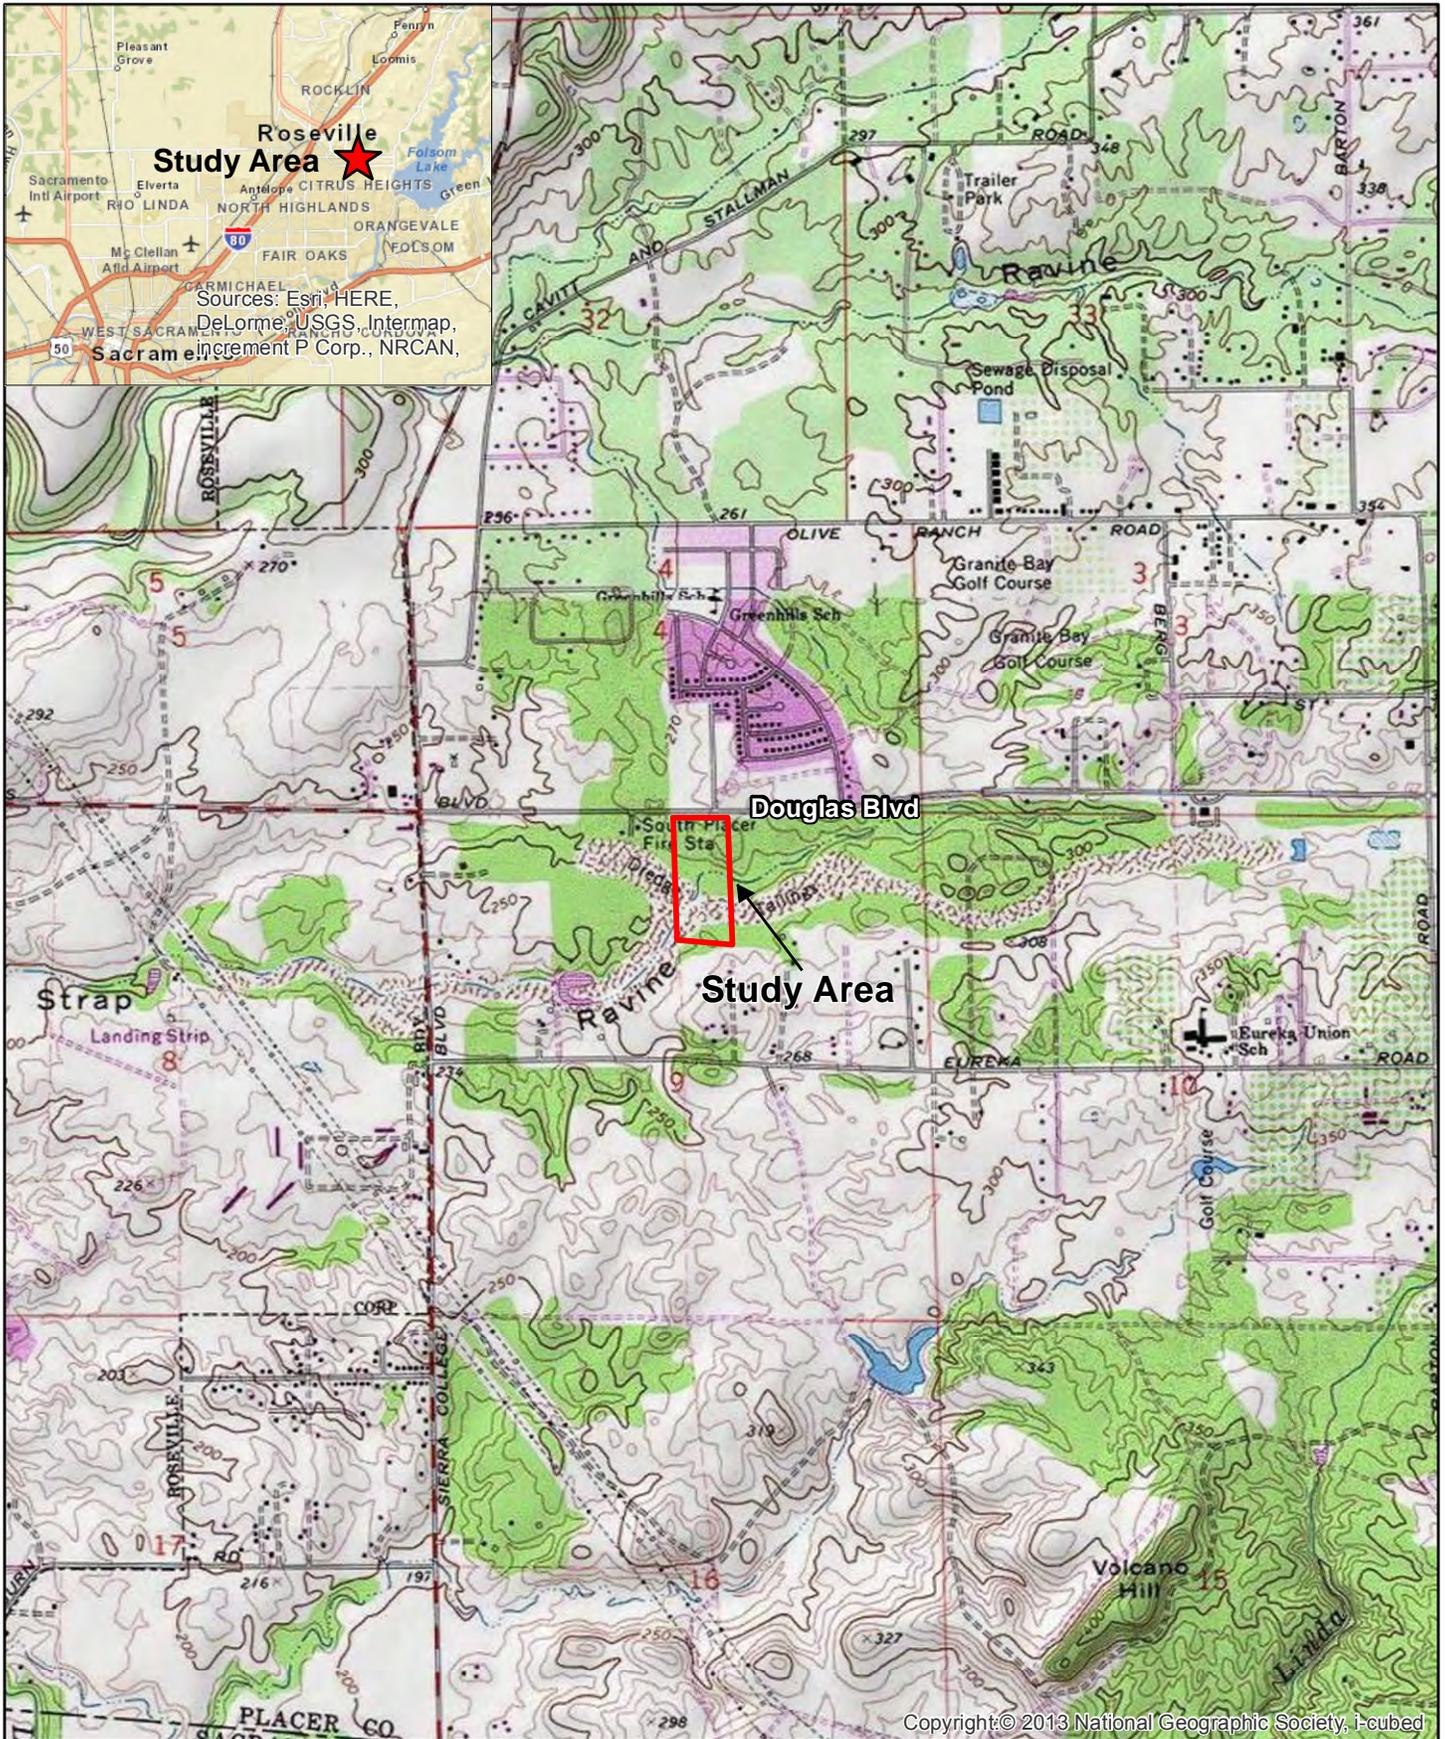

A handwritten signature in blue ink that reads "Jeff Glazner". The signature is written in a cursive, flowing style.

Jeff Glazner

MEMORANDUM

To: Dave Cook,
From: Jeff Glazner and Jinnah Benn
Date: February 21, 2018
Subject: Biological Reconnaissance, Whitehawk II proposed EVA Easement and Construction Access Easement

At your request, Salix Consulting has conducted a biological reconnaissance of the proposed easements for Emergency Vehicle Access (EVA) and for construction access for drainage improvements for the proposed Whitehawk II subdivision project, located in the community of Granite Bay, Placer County, California. The study area is located just west of Quartzite Circle, between Douglas Boulevard and Eureka Road, in the western portion of Granite Bay (Figure 1)

Introduction

The proposed easement for the EVA for the Whitehawk II subdivision project extends from a proposed roadway on the northeast side of the subdivision, 180 linear feet in a southeasterly direction to its terminus at Quartzite Circle. The proposed easement is 25 feet wide; the proposed roadway width is 20 feet. The entire easement occupies approximately 0.33 acre (Figure 2).

The proposed easement for access and construction for drainage improvements is approximately 0.10 acre in size and is located immediately south of the EVA easement, along the neighboring property line.

Objectives

The Objectives of the reconnaissance survey were to:

- Identify and describe the biological communities present within the proposed easement;
- Evaluate the easement for the potential to support special-status plant and animal species.
- Determine if wetlands or other aquatic features are present within the proposed easement.

Methodology

Prior to conducting the survey, the Biological Resource Assessment updated in December 2014 was reviewed, as were drawings of the proposed easement alignments. The biological reconnaissance surveys were conducted July 31, 2017, February 7, and February 14, 2018 by walking both easements and assessing the EVA corridor and the construction access easement for the presence or absence of sensitive biological and wetland issues. Photographs of

representative portions of the EVA easement and the proposed construction easement are presented in Figures 3 and 4, respectively.

EVA Findings

The proposed EVA easement traverses a rather dense and shrubby foothill woodland, comprised primarily of interior live oak (*Quercus wislizeni*). Other woody components include valley oak (*Q. lobata*), Himalayan blackberry (*Rubus armineacus*), and coyote bush (*Baccharis pilularis*) (Figure 3).

The corridor lacks suitable habitat for special status plants known from the region, particularly because there are no wetlands within the corridor. The proposed EVA does not support any elderberry plants (*Sambucus nigra*) and therefore, does not support habitat for the federally threatened valley elderberry longhorn beetle.

Special status animals potentially occurring in the EVA corridor are limited to birds. The woodland is suitable habitat for nesting raptors and migratory birds, including purple martin, which may nest in cavities in the mature trees within and surrounding the proposed EVA alignment.

No waters of the U.S. (WOUS) are present within the proposed EVA alignment.

Construction Access/Easement Findings

The proposed construction access easement is also located in rather dense foothill woodland, comprised primarily of interior live oak. Other woody components include poison oak (*Toxicodendron diversilobum*), and coyote bush. There is one mature cottonwood (*Populus fremontii*) within the access easement (Figure 4).

A man-made ditch, an artifact of past land use, is located within the construction access easement area. This ditch has not been formally delineated and therefore the Corps has not evaluated it with regard to their jurisdiction. The ditch is mostly unvegetated (under a dense live oak canopy) and does not appear to carry water on a consistent basis (it may not carry water under normal conditions but only during flood flows). The ditch connects, however, to a large existing seasonal wetland complex within the Whitehawk II project area that was verified by the Corps as wetland in 2015. Because this ditch has not been formally delineated and submitted to the Corps for verification, we are placing it on the attached map as “potentially jurisdictional” and considering the proposed area of project disturbance to be an impact to a waters of the U.S. (Figure 5).

Recommendations

Waters of the U.S.

A man-made ditch is located within the construction access easement. No fill should be placed within this feature without first determining if the feature is a WOUS. If it is determined by the Corps of Engineers to be a WOUS, permits are required under Sections 404 and 401 of the Clean Water Act for placing fill within the ditch.

Tree Conservation

Policy 5.3.15 of the Granite Bay Community Plan requires that Placer County's Tree Preservation Ordinance be implemented for all projects within the community of Granite Bay (Placer County 2012). The Tree Preservation Ordinance specifies requirements for the protection, preservation, and maintenance of native oak trees, trees of historic or cultural significance, groves and stands of mature trees, and mature trees in general, which are associated with proposals for development. An arborist's report is being prepared for the proposed EVA easement, and the construction access easement. The applicant should consult with Placer County to determine what provisions of the ordinance are applicable.

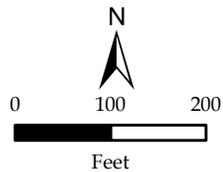

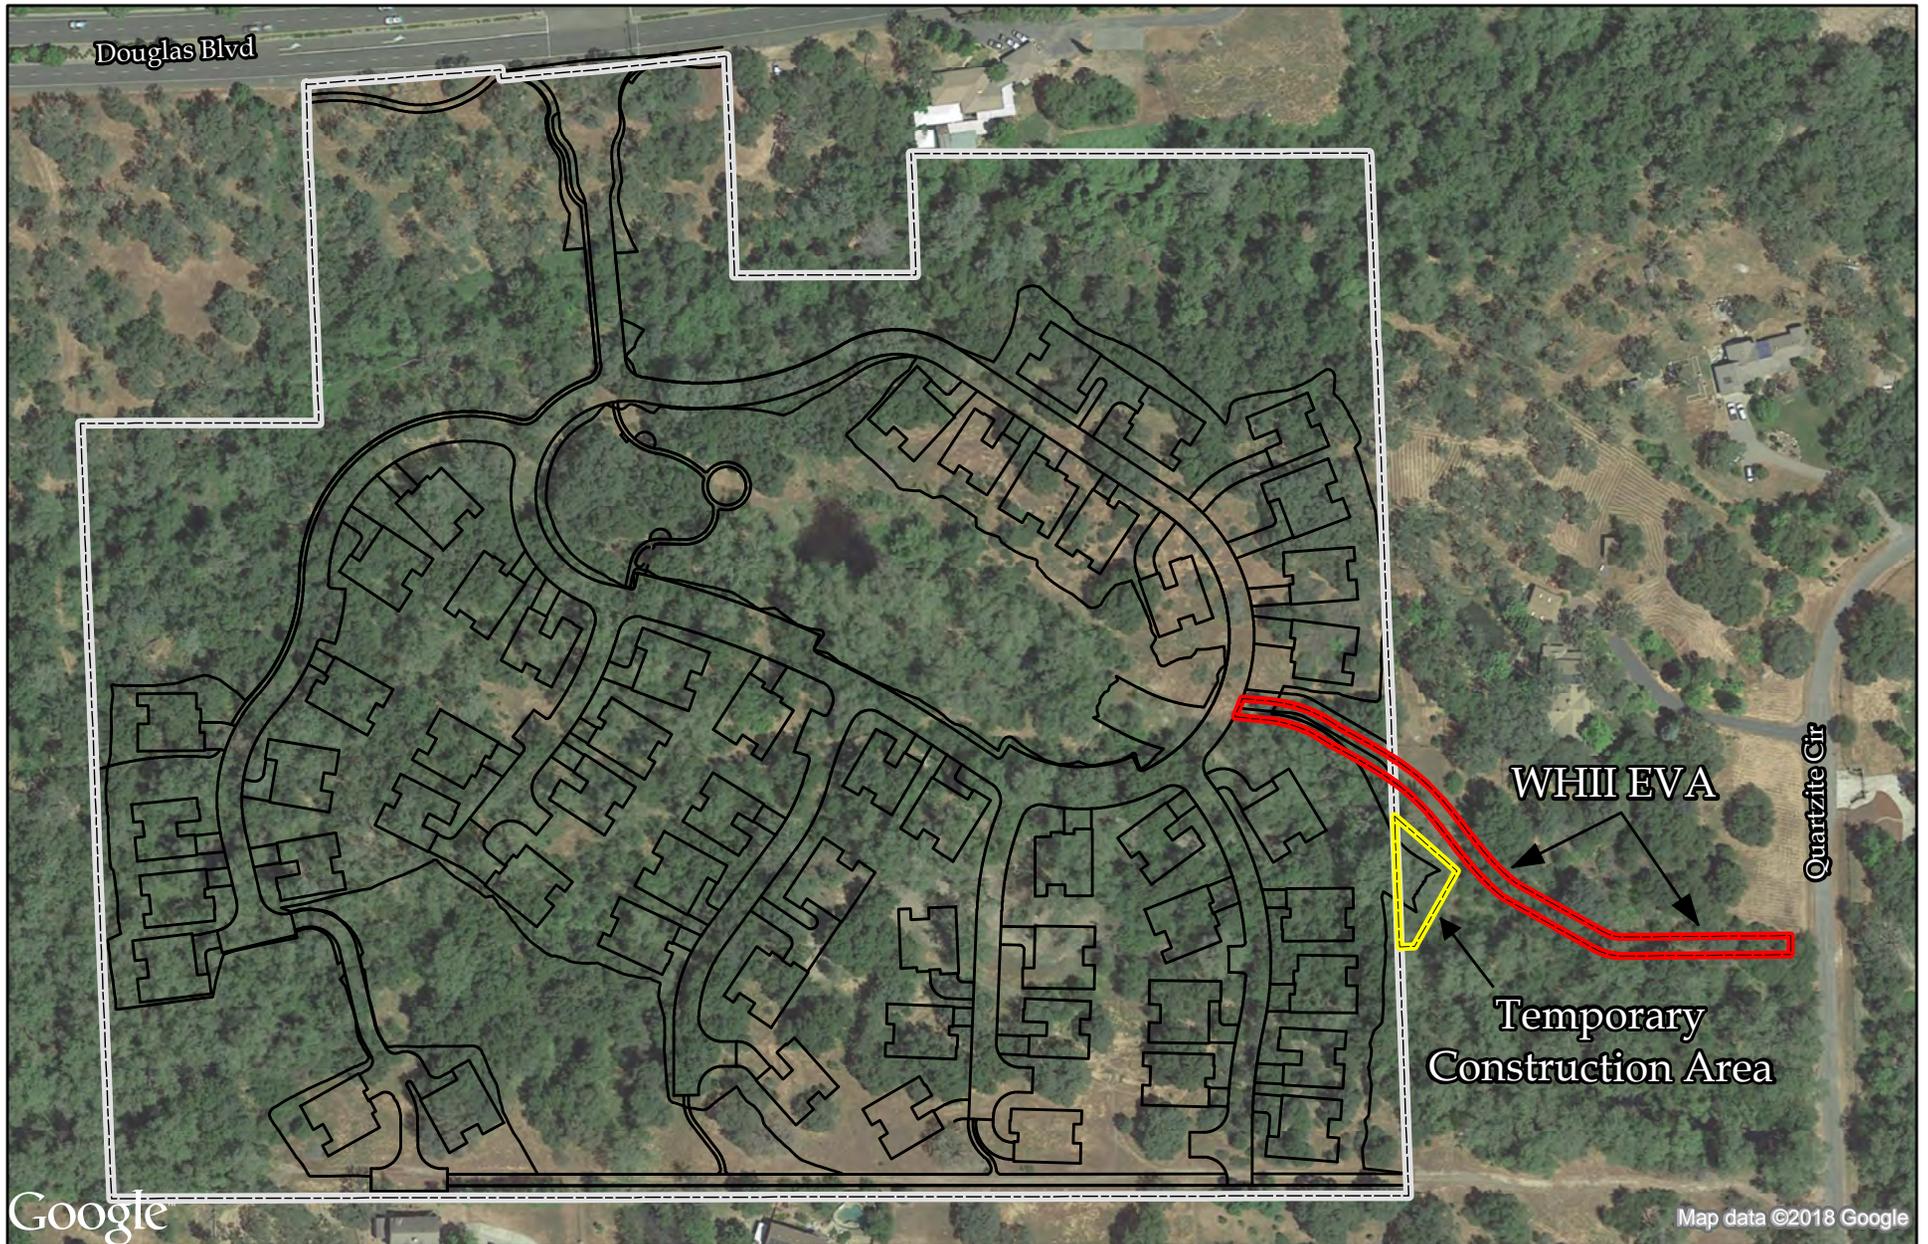

Special-status Plants

No habitat needed to support any special-status plants known from the region is present within either of the easements. No further studies are recommended.

Pre-Construction Nesting Surveys

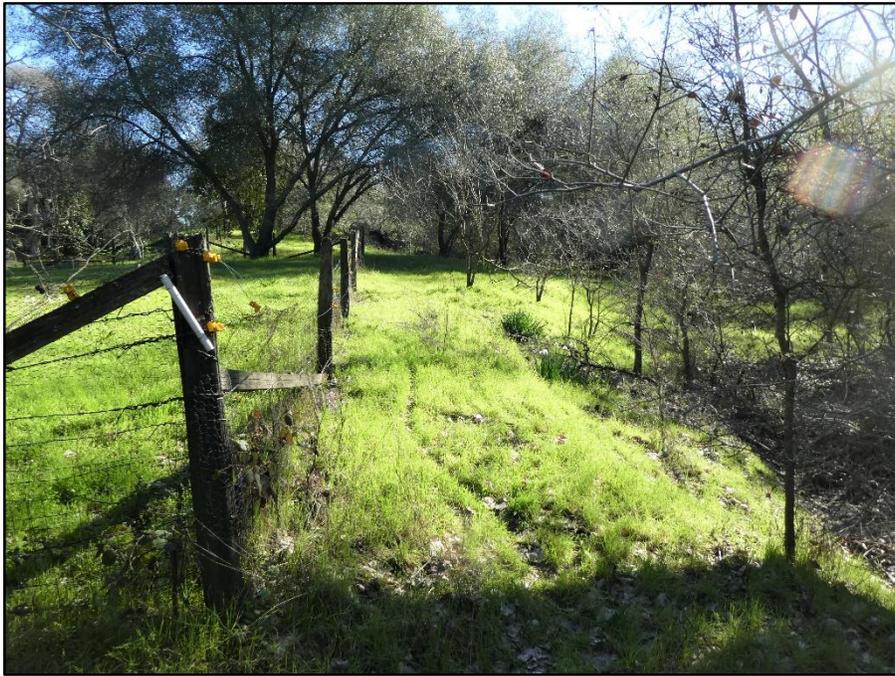

Foothill woodland throughout the site provides suitable nesting habitat for common raptors and other birds protected by the Migratory Bird Treaty Act that are known from the region. Suitable raptor nesting habitat includes the mature oaks and cottonwoods located throughout the proposed easements. If tree removal activities take place during the associated breeding/nesting season (typically February 1 through August 31), disturbance of nesting activities could occur. Take of any active raptor nest is prohibited under California Fish and Game Code sections 3503, 3503.5, and 3513. To avoid take of active nests, necessary tree removal should occur outside of the typical nesting season for raptors and other bird species. If tree removal must occur at any time during the typical nesting season, a pre-construction survey should be conducted by a qualified biologist no more than 15 days prior to initiation of proposed development activities. If active nests are found on or immediately adjacent to the site, CDFW should be contacted to determine appropriate avoidance measures. If no nesting is found to occur, necessary tree removal could then proceed.

The quality of habitat available for purple martin, a California Species of Concern, within the study area is considered marginal, but it is possible that purple martin may nest within the easements due to the presence of snags and cavities in mature trees. Although nesting of this species within the two easements is unlikely, implementation of pre-construction surveys is recommended to avoid any potential disturbance. Pre-construction surveys implemented as described above for nesting raptors and migratory birds should include surveying for purple martin.

Executive Summary

Salix, Inc. on behalf of Meritage Homes, Inc., contacted Abacus Consulting Arborists to inventory and evaluate the protected trees which could be impacted by the proposed Emergency Vehicle Access for the project Whitehawk II, and produce an Arborist Report as the end product. The EVA property is located between the eastern boundary of WHII and Quartzite Circle along the south boundary of 8403 Quartzite Circle in Granite Bay, California. See Tree Location Map.

Abacus Consulting Arborists was on site on February 10-27, 2018; providing species identification, number of trunks, measurements of DBH and canopy, field condition notes, recommended actions, ratings, and locations of the protected trees.

There are 63 trees surveyed that qualify as “protected trees” by the standards of the Placer County Municipal Code, Article 12.16 – Tree Preservation Generally.

<u>Tree Species</u>	<u>Surveyed Trees</u>	<u>Trees with Impacts¹ resulting in Early Demise and/or Requiring Removal²</u>	<u>Trees with Potential Impacts causing Early Demise³</u>
Interior Live Oak	42	16	8
Blue Oak	14	5	6
Fremont Cottonwood	6	2	0
Valley Oak	1	0	0
	63	23	14

See Chart B – Inventory of Trees for specific information on each tree.

See Conclusion Chart C – Proposed Tree Impacts

In addition, native trees which did not meet the size requirement for protection, located within an adjacent area appearing to include a water channel which may be considered a riparian area were included on the Tree Location Map for reference. These trees which did not meet the size requirement were not evaluated and are not included in this report but are shown as a dark blue dot on the attached Tree Location Map.

All trees to be preserved shall be protected by following the ‘General Development Guidelines’. In addition, there are trees to be preserved on the neighboring properties that will be impacted by the development and may require special preservation measures due to their proximity to the grading and other development work. The project arborist should inspect the site after installation of exclusionary fencing and prior to grading or grubbing to determine any additional preservation requirements for these trees.

See General Development Guidelines

¹ Impacts occur when development activities, including grading or trenching, are within the protected root zone defined for each tree in Chart B.

² Trees are located in the path of development or have impacts considered Severe or Critical. See Conclusion.

³ Preservation Measures could protect these trees and result in long term survival. See Conclusion.

Methods

The trees (on-site) tagged by ABACUS have a numbered tag, placed on each one that is 1-1/8" x 1-3/8", green anodized aluminum, "acorn" shaped, and labeled: ABACUS, Auburn, CA with 1/4" pre-stamped tree number and Tree Tag. They are attached with a natural colored aluminum 10d nail, installed at approximately 6 feet above ground level on the approximate north side of the tree. The tag should last ~10 – 20+ years depending on the species, before it is enveloped by the trees' normal growth cycle.

A Level 2 – Basic Visual Assessment was performed in accordance with the International Society of Arboriculture's best management practices. This assessment level is limited to the observation of conditions and defects which are readily visible. Additional limiting factors, such as blackberries, poison oak, and/or debris piled at the base of a tree can inhibit the visual assessment.

Tree Location: The GPS location of each tree was collected using the ESRI's ArcGIS collector application on an Apple iPad. The data was then processed in ESRI's ArcMap by Julie McNamara, M.S. GISci, to produce the tree location map.

Tree Measurements: DBH (diameter breast high) is normally measured at 4'6" (above the average ground height for "Urban Forestry"), but if that varies then the location where it is measured is noted. A Haglöf Mantax Caliper was used to measure the DBH for trees less than 32" in diameter or less and a steel diameter tape for trees greater than 32". The canopy extension was measured with a Nikon Forestry Pro laser rangefinder.

Terms

<u>Field Tag #</u>	The pre-stamped tree number on the tag which is installed at approximately 6 feet above ground level on the north side of the tree unless otherwise indicated in the notes.
<u>Protected</u>	Indicates if the tree qualifies as a "protected tree" by the standards of the County of Placer, Article 12.16 – Tree Preservation Generally.
<u>Species (Common Name and Botanical Name)</u>	The species of a tree is listed by our local common name and industry accepted botanical name by genus (capitalized) and species (lower case). Our native oaks frequently cross-pollinate and hybridize, but the identification is towards the strongest characteristics.
<u>DBH</u>	'Diameter Breast High' is normally measured at 4'6" (above the average ground height for "Urban Forestry"), but if the measurement was taken at another location it is noted here. A Swedish caliper ^[1] was used to measure the DBH for trees less than 30" in diameter and a steel diameter tape ^[2] for trees greater than 30"Ø.
<u>Measured Canopy radius – also referred to as Dripline</u>	The farthest extent of the crown composed of leaves and small twigs and is the longest dripline measurement from the center point of the tree.
<u>Notes:</u>	Provide notable details about each tree which are factors which should be considered in the determination of the tree rating including: (a) condition of root crown and/or roots; (b) condition of trunk; (c) condition of limbs and structure; (d) growth history and twig condition; (e) leaf appearance; and (f) dripline environment. In addition, if there were any limitations to the evaluation of the tree, they are listed here. For example, a tree wrapped in poison oak may not have been examined at the base.
<u>Clearance Pruning Required</u>	Indicates if pruning will be required within the measured canopy radius (dripline) to access this area within 20' of the ground.
<u>Placer County Rating</u>	Placer County Municipal Code – 12.17.070, Section G provides specific instruction on the determination of tree condition. The listed rating is pursuant to these specifications.
<u>Arborist Rating</u>	Subjective to condition and is based on both the health and structure of the tree. All of the trees were rated for condition, per the recognized national standard as set up by the Council of Tree and Landscape Appraisers and the International Society of Arboriculture (ISA) on a numeric scale of 5 (being the highest) to 0 (the worst condition, dead) as in Chart A. The rating was done in the field at the time of the measuring and inspection. The scale is as follows:

Table A – Ratings Table

Arborist Ratings		Rating Number	Placer County Condition Rating
No problem(s)	Excellent	5	Excellent
No apparent problem(s)	Good	4	Good
Minor problem(s)	Fair	3	Fair to Good
Minor problem(s)		2-3	Fair
Major problem(s)	Poor	2	Fair to Poor
Extreme problem(s)	Hazardous	1	Poor
Dead	Dead	0	Dead

Rating #0: This indicates a tree that has no significant sign of life.

Rating #1: The problems are extreme. This rating is assigned to a tree that has structural and/or health problems that no amount of work or effort can change. The issues may or may not be considered a dangerous situation.

Rating #2: The tree has major problems. If the option is taken to preserve the tree, its condition could be improved with correct arboricultural work including, but not limited to: pruning, cabling, bracing, bolting, guying, spraying, mistletoe removal, vertical mulching, fertilization, etc. If the recommended actions are completed correctly, hazard can be reduced and the rating can be elevated to a 3. If no action is taken the tree is considered a liability and should be removed.

Rating #3: The tree is in fair condition. There are some minor structural or health problems that pose no immediate danger. When the recommended actions in an arborist report are completed correctly the defect(s) can be minimized or eliminated.

Rating #4: The tree is in good condition and there are no apparent problems that a Certified Arborist can see from a visual ground inspection. If potential structural or health problems are tended to at this stage future hazard can be reduced and more serious health problems can be averted.

Rating #5: No problems found from a visual ground inspection. Structurally, these trees have properly spaced branches and near perfect characteristics for the species. Highly rated trees are not common in natural or developed landscapes. No tree is ever perfect especially with the unpredictability of nature, but with this highest rating, the condition should be considered excellent.

Development Impact Indicates if the tree is planned for removal or preservation, and if preserved, the relative impact of the proposed development according to the development plans. The scale is as follows:

Table B – Impacts Table

Impact Term:	Long Term Result of Impact:
Negligible	Tree is unlikely to show any symptoms. Chance of survival post development is excellent. Impacts to the Protected Root Zone (see Glossary) are less than 5%.
Minor	Tree is likely to show minor symptoms. Chance of survival post development is good. Impacts to the Protected Root Zone are less than 15% and species tolerance is good.
Moderate	Tree is likely to show moderate symptoms. Chance of survival post development is fair. Impacts to the Protected Root Zone are less than 35% and species tolerance is good or moderate.
Severe	Tree is likely to show moderate symptoms annually and a pattern of decline. Chance of long term survival post development is low. Impacts to the Protected Root Zone are up to 50% and species tolerance is moderate to poor.
Critical	Tree is likely to show moderate to severe symptoms annually and a pattern of decline. Chance of long term survival post development is negligible. Impacts to the Protected Root Zone are up to 80%.

Chart B –Inventory of Trees

Field Tag #	Old Tag #	Protected	Species Common Name	Species Botanical Name	DBH	Canopy radius	Notes	Clearance Pruning, if required	Placer County Rating	Arborist Rating	Development Impact
2202		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	14 @ 1'	20	old 2304, very poor structure, main stem doglegs with new sprouts upward. Mainstem poor structure crossing limbs, bows over		Fair to Poor	2 Major Structure or Health Problems	Negligible
2203		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	12	18	good flare, main canopy lean S, fair leaf surface		Fair to Good	3 Fair - Minor Problems	Negligible
2204		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	13 @ 1'	18	codominant leader at 2' included bark, suppressed, entire canopy bows North East, fair leaf surface		Fair to Poor	2 Major Structure or Health Problems	Moderate
2205		Yes	Blue Oak	<i>Quercus douglasii</i>	7	6	good flare, poor taper, fair leaf surface		Fair to Good	3 Fair - Minor Problems	Negligible
2206		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	24@ 6"	22	Low structural limb east at 1', codominant leader at 6', fair leaf surface		Good	4 Good - No Apparent Problems	Severe - May Require Removal
2207		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	14	25	good flare, slight bend in trunk, abnormal trunk shape, fair canopy		Fair	3 Fair - Minor Problems	Moderate
2208		Yes	Blue Oak	<i>Quercus douglasii</i>	14	25			Fair to Good	3 Fair - Minor Problems	Severe - May Require Removal

Field Tag #	Old Tag #	Protected	Species Common Name	Species Botanical Name	DBH	Canopy radius	Notes	Clearance Pruning, if required	Placer County Rating	Arborist Rating	Development Impact
2209	2315	Yes	Interior Live Oak	<i>Quercus wislizenii</i>	10, 6, 15	25	steep slope, main stem is upright included barked at 6', smaller stem very poor structure runs along the ground, fair leaf surface		Fair to Poor	2 Major Structure or Health Problems	Severe - May Require Removal
2210		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	15	28	steep slope at base, leans north from base, fair leaf surface. Lean is probably not overly significant- should be retained		Fair	2 Major Structure or Health Problems	Severe - May Require Removal
2211		Yes	Blue Oak	<i>Quercus douglasii</i>	8.5	13	codominant leader it 10' narrow attachment, poor twig elongation, good leaf surface		Excellent	4 Good - No Apparent Problems	Moderate
2212		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	8, 5	10	codominant leader at 6 inches, good leaf surface		Fair to Good	3 Fair - Minor Problems	Negligible
2213		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	12	25	low structural limb, good flare, codominant leader at 4' narrow and crossing, good leaf surface		Fair	3 Fair - Minor Problems	Moderate
2215		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	8	25	failure from base, half ripped out of ground, canopy at 5' off the ground		Poor	1 Extreme Structure or Health Problems	Minor
2216		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	8, 6	17	12 @ ground, lean and bow north west, poor structure		Fair to Poor	2 Major Structure or Health Problems	Negligible

7031		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	6	0	on steep slope, slight lean		Fair to Good	3 Fair - Minor Problems	Negligible
7033		Yes	Blue Oak	<i>Quercus douglasii</i>	18	34	small abnormal stem at 1' off the ground north west, good structure, good leaf surface, bird nest in upper canopy		Good	4 Good - No Apparent Problems	Minor
7034		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	9, 5	33	slight lean, included bark at 2', and entire canopy understory south		Fair	3 Fair - Minor Problems	Moderate
7035		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	16, 17	32	re-grade at base?, Good flare but appears buried east, codominant leader removed at ground level east, wound wood with decay cavity, codominant leader at 3' with included bark and at 5', good leaf surface		Fair to Good	3 Fair - Minor Problems	Moderate
7037		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	7	18	understory, poor structure, bows at 8 to 12' off the ground		Fair	2 Major Structure or Health Problems	Critical - May Require Removal
7038		Yes	Fremont Cottonwood	<i>Populus fremontii</i>	21	35	leans from ground, more significant above 10', overextended, large failures		Fair to Poor	2 Major Structure or Health Problems	Critical - May Require Removal

Field Tag #	Old Tag #	Protected	Species Common Name	Species Botanical Name	DBH	Canopy radius	Notes	Clearance Pruning, if required	Placer County Rating	Arborist Rating	Development Impact
7039		Yes	Fremont Cottonwood	<i>Populus fremontii</i>	26, 34, 12, 29, 18, 10, 16, 20	35	Large tree cluster, 2 center stems are upright in fair condition, the rest have too much lean and over extended or declining with epicormic growth		Fair to Poor	2 Major Structure or Health Problems	Critical - May Require Removal
7041		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	7	20	old 2154, steep slope, bows at 4' over riparian area, poor structure, poor leaf surface		Fair to Poor	2 Major Structure or Health Problems	Moderate
7042		Yes	Valley Oak	<i>Quercus lobata</i>	8	8	steep slope, under Cottonwood, fair now but will be suppressed		Fair to Good	3 Fair - Minor Problems	Minor
7043		Yes	Blue Oak	<i>Quercus douglasii</i>	6	10	steep slope, poor crown ratio, poor leaf surface		Fair	3 Fair - Minor Problems	Moderate
7044		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	6	20	old 2160, leans from ground, understory		Fair to Poor	2 Major Structure or Health Problems	Negligible
7045		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	19	30	good flare, upper canopy liens 30 degrees, fair to good leaf surface		Good	4 Good - No Apparent Problems	Minor
7046		Yes	Fremont Cottonwood	<i>Populus fremontii</i>	60	35	good for species, upright, overextended limb south		Fair	2 Major Structure or Health Problems	Minor

Field Tag #	Old Tag #	Protected	Species Common Name	Species Botanical Name	DBH	Canopy radius	Notes	Clearance Pruning, if required	Placer County Rating	Arborist Rating	Development Impact
7047		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	16	25	on steep slope, 5 inch limb at 1' along the ground south, 40 degree lean south, unbalanced canopy south, fair leaf surface		Fair	3 Fair - Minor Problems	Minor
7048		Yes	Blue Oak	<i>Quercus douglasii</i>	7	8	good upright structure, good flare, codominant leader at 10', under Cottonwood. Good for now will be suppressed		Good	4 Good - No Apparent Problems	Negligible
7049		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	7	15	leans from base with partial correction, good leaf surface		Fair to Good	3 Fair - Minor Problems	Critical - May Require Removal
7050		Yes	Interior Live Oak	<i>Quercus wislizenii</i>	6	10	suppressed, poor structure at top		Fair	2 Major Structure or Health Problems	Critical - May Require Removal
7032		Yes	Blue Oak	<i>Quercus douglasii</i>	10, 9	21	codominant leader at 1' cavity between, both systems, bow at top, most limbs are unbalanced to south or east		Fair	2 Major Structure or Health Problems	Severe - May Require Removal

Limitations

All of the conclusions in this report are based solely on the observation of conditions on the site which were readily visible. Trees may appear to be healthy and structurally sound but can contain hidden faults which could result in failure.

Blackberries, Poison Oak and/or Debris (such as limbs, firewood, garbage, etc) visually inhibit the observation of critical defects at the base of a tree such as decay or evidence of decay agents (mushrooms or conks). They also can hide ground heaving, compacted soil, soil contamination, and many other critical evaluation details. Whenever these conditions exist, the visual assessment was limited and the tree should be reevaluated upon removal of the inhibiting condition.

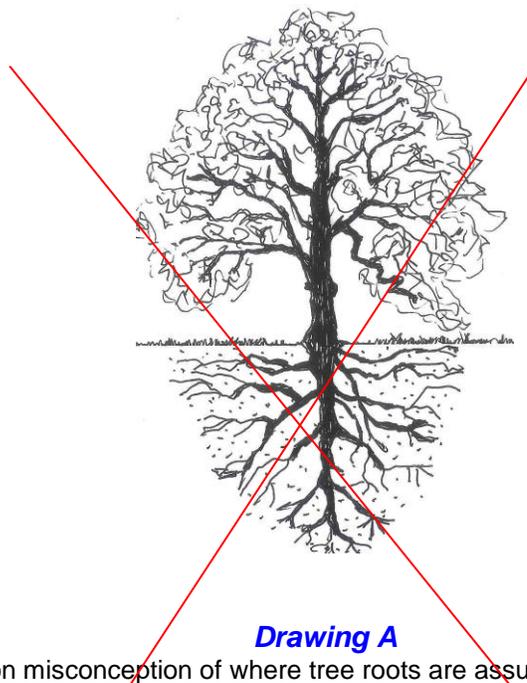

Level of Inspection, Testing and Analysis

A Level 2 – Basic Visual Assessment was performed in accordance with the International Society of Arboriculture’s best management practices. No laboratory testing or analysis was performed.

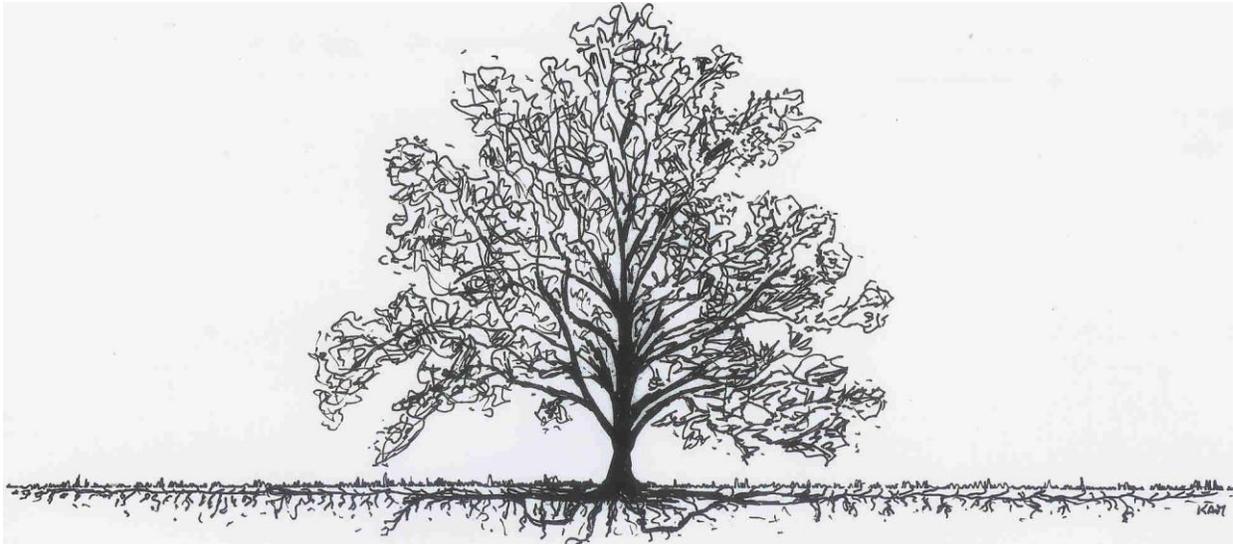

Discussion

Root Structure

The majority of a tree’s roots are contained in a radius from the main trunk outward approximately two to three times the canopy of the tree. These roots are located in the top 6” to 3’ of soil. It is a common misconception that a tree underground resembles the canopy (see Drawing A below). The correct root structure of a tree is in Drawing B. All plants’ roots need both water and air for survival. Surface roots are a common phenomenon with trees grown in compacted soil. Poor canopy development or canopy decline in mature trees is often the result of inadequate root space and/or soil compaction.

Drawing A
Common misconception of where tree roots are assumed to be located

Drawing B

The reality of where roots are generally located

Arborist Classifications

There are different types of Arborists:

Tree Removal and/or Pruning Companies. These companies may be licensed by the State of California to do business, but they do not necessarily know anything about trees;

Arborists: Arborist is a broad term. It is intended to mean someone with specialized knowledge of trees but is often used to imply knowledge that is not there.

ISA Certified Arborist: An International Society of Arboriculture Certified Arborist is someone who has been trained and tested to have specialized knowledge of trees.

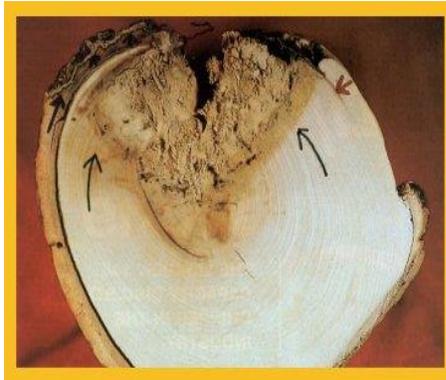

Consulting Arborist: An American Society of Consulting Arborists Registered Consulting Arborist is someone who has been trained and tested to have specialized knowledge of trees and trained and tested to provide high quality reports and documentation.

Decay in Trees

Decay (in General): Fungi cause all decay of living trees. Decay is considered a disease because cell walls are altered, wood strength is affected, and living sapwood cells may be killed. Fungi decay wood by secreting enzymes. Different types of fungi cause different types of decay through the secretion of different chemical enzymes. Some decays, such as white rot, cause less wood strength loss than others because they first attack the lignin (causes cell walls to thicken and reduces susceptibility to decay and pest damage) secondarily the cellulose (another structural component in a cell walls). Others, such as soft rot, attack the cellulose chain and cause substantial losses in wood strength even in the initial stages of decay. Brown rot causes wood to become brittle and fractures easily with tension. Identification of internal decay in a tree is difficult because visible evidence may not be present.

According to Evaluation of Hazard Trees in Urban Areas (Matheny, 1994) decay is a critical factor in the stability of the tree. As decay progresses in the trunk, the stem becomes a hollow tube or cylinder rather than a solid rod. This change is not readily apparent to the casual observer. Trees require only a small amount of bark and wood to transport water, minerals and sugars. Interior heartwood can be eliminated (or degraded) to a great degree without compromising the transport process. Therefore, trees can contain significant amounts of decay without showing decline symptoms in the crown.

Compartmentalization of decay in trees is a biological process in which the cellular tissue around wounds is changed to inhibit fungal growth and provide a barrier against the additional cells. The weakest formation of the vertical wall. be able to limit decay pruning cuts, in the event that pruning cut located vertically

spread of decay agents into of the barrier zones is the Accordingly, while a tree may progression inward at large there are more than one along the main trunk of the tree, the likelihood of decay progression and the associated structural loss of integrity of the internal wood is high.

Oak Tree Impacts

Our native oak trees are easily damaged or killed by having the soil within the Critical Root Zone (CRZ) disturbed or compacted. All of the work initially performed around protected trees that will be saved should be done by people rather than by wheeled or track type tractors. Oaks are fragile giants that can take little change in soil grade, compaction, or warm season watering. Don't be fooled into believing that warm season watering has no adverse effects on native oaks. Decline and eventual death can take as long as 5-20 years with poor care and inappropriate watering. Oaks can live hundreds of years if treated properly during construction, as well as later with proper pruning, and the appropriate landscape/irrigation design.

Conclusion:

There are 63 trees that qualify as 'protected' according to the Placer County Code, Article 12.16, of which 23 will have impacts resulting in early demise or could be proposed for removal.

Protected Tree Status	Tree Count	Inches ⁴
Trees to Remain on the Site	40	459
Trees with Impacts Causing Early Demise	23	429
Tree with Impacts to be Determined	14	176.50

Projected development impacts are based solely on distance relationships between tree location and grading and/or trenching. Field inspections and findings during the project at the time of grading and trenching can change relative impacts. Closely followed guidelines and restrictions

⁴ Inches are DBH for single trunk trees and DBH added together for multi-stem trees

can result in a higher chance of survival, while restrictions that are overlooked can result in a dramatically lower chance of survival. **The final impact will be measured at project completion and reported by the project arborist in the 'Final Compliance Letter'.**

General Development Guidelines and Tree Preservation Plan

Development Guidelines

- 1 No wheeled equipment or pickup trucks shall be allowed on site until exclusionary tree fencing is installed and inspected by project arborist.
- 2 All of the trees to be removed or pruned shall be chipped onsite to the greatest degree possible. The chips are to be used under the trees that are to remain as mulch in the Protected Root Zone.
- 3 All of the trees to remain shall have mulch installed in the Protected Root Zone 4 - 6" deep prior to grading and/or grubbing. It is preferred this mulch is from the trees to be removed, however, other mulch may be used but it is required to be arborist type woodchips (4 – 6" deep), but not redwood or cedar bark. Redwood or Cedar bark mulch will not be accepted. If applied, it will be required to be removed and placed on top of the required arborist type mulch.
- 4 All trees to be saved shall have their root zones and trunk(s) protected with exclusionary fencing. Unless otherwise specified by the City or County, a four (4') foot high orange or yellow plastic, high visibility fence shall be installed surrounding the trees' root zone (defined by canopy radius), hereafter referred to as the Protected Root Zone. The fence shall be staked 10' o.c. maximum spacing, with 5' steel "T" posts, 2" x 2" square or 2"+ Ø wood posts. The Protected Root Zone area shall extend out to the tree's longest dripline radius plus one foot, as a circle. See Arborist Report - Chart B for radius measurement for each individual tree. The fencing shall completely surround the trees' root zone and not be "U" shaped or open at any point. Whenever possible, include as many trees that are to be saved into one fenced exclusionary Protected Root Zone. The fencing shall be maintained and not moved or removed until the final arborist inspection at the completion of construction.
- 5 No material storage, people, portable outhouses, vehicles, or dogs shall be allowed in the Protected Root Zone.
- 6 Utility-trenching paths are to be placed outside the Protected Root Zone unless previously approved by project Arborist.
- 7 The cut and fill material excavated from or added to the lot can kill trees by removing too many roots, drying/wetting the soil, or by suffocating the roots with too much soil. If fill material is needed within 20' of the Protected Root Zone, properly designed aeration/ventilation systems made to protect the trees and allow for the fill material can be installed.
- 8 Limestone gravel shall not be used as base material or for drain rock as it will change the pH to be more alkaline, and may harm the trees.

- 9 Soil contamination shall be avoided by eliminating chemical dumping on the property that may infiltrate into the Protected Root Zone. **No**: washing, dumping, or contaminating the site including but not necessarily limited to the following: concrete from tools or trucks, paint materials, sheetrock mud or stucco materials, other chemicals, solvents, herbicides, etc.
- 10 Irrigation is required once per month for trees to remain within 30' of any grading activity during the months of May - November, unless 1" of rain has been recorded within the 2 week period of the required irrigation.
- 11 Irrigation is required as soon as the concrete is poured and footings and stem walls are backfilled. The protected trees within 30' should be watered to the point of soil saturation at a minimum depth of 12".
- 12 Do not nail, tie, screw, or fasten any signs, braces, etc. to the trees that are to remain.
- 13 Pruning is to be completed by a qualified ISA Certified Arborist or under the direct supervision of the project arborist. No cutting of live wood over 2"Ø shall be made. All cutting, pruning, trimming, cabling, guying, bracing, and lightning protection systems shall conform to the most current standards of the American National Standards Institute (ANSI). The current ANSI Tree Care Standards are A300 (Parts 1-4) 2000 to 2002 (copies at: www.ansi.org). The BMPs are "Best Management Practices", as companion publications to the ANSI Tree Care Standards, printed by the International Society of Arboriculture (copies at: www.isa-arbor.com). The BMP booklets explain the details of the ANSI Tree Care Standards and how to follow them correctly. Pruning of branches under 3" in diameter should be made with sharp hand tools: pruners, loppers, and/or handsaws, not chainsaws.

Glossary

Bow: A structural condition in the main trunk or structural limbs of the tree where there is a U shape and the canopy turns back toward the ground. Often a result of suppression.

Broadleaf Mistletoe infested tree. Broadleaf mistletoe, *Phoradendron villosum*, is an evergreen parasitic that grows on many hardwood trees and is spread most commonly by birds excreting the living seeds onto woody branches where they germinate. It is important to stop the spread by correctly removing the mistletoe plant by either pruning off the branch it lives on (if small enough) or by removing its light source and killing the parasite. Pruning: remove the branch at least 12" below the point of attachment to the next lateral using an approved thinning-type cut. Light exclusion: remove the mistletoe to flush with limb or trunk where it is attached and wrap the limb/trunk with 2-3 layers 6 mil polyethylene plastic 8" above and below the point of attachment. Tape it with a few wraps of electrical tape to keep all light out to kill the mistletoe, remove in 2-3 years.

Canker: A localized diseased area on stems, roots, or branches. Often shrunken, discolored, or causing splits or bark to slough.

Co-Dominant Leader: Stems or trunks of the tree that are equal in size and of the same relative importance. They may or may not have included bark.

Critical Root Zone: A circular area around a tree where damage to the roots will critically impact the health of the tree. It is often defined with a radius equal to a tree's largest dripline radius or dripline radius plus 1' (defined by the local jurisdiction's code). It can be adjusted by a qualified arborist to match the current condition of the tree. For example a tree in poor health will require a larger CRZ than a tree of the same size in good condition to not be critically impacted.

Epicormic Growth: Shoots that arise from latent buds along the trees trunk or mature branches. This growth is usually a sign that the tree has undergone a stressful period.

High Voltage Lines: High voltage lines are above or in close proximity to the tree. Generally noted due to the associated clearance pruning performed by the utility company and resulting wounds and/or poor structure.

Included Bark: A sharp "V" crotch, usually less than a 45° angle of attachment, between 2 branches where the bark is kept is continually turned inward, rather than being pushed out. It is a considered a structural fault and increases the likelihood of structural failure. The potential for hazard can be minimized with properly installed and maintained cabling, bolting or bracing, or regular reduction pruning.

Live Crown Ratio: Ratio of the height of the crown containing live foliage to the overall height of the tree.

Narrow Angle Attachment: A sharp "V" crotch, usually less than a 45° angle of attachment. Included bark is explained above and is common in branches with narrow attachments. In addition, these branches may not be attached to the trunk as well as others with wider angles of attachment, and can fail more frequently depending on the ratio of the size of the branch compared to the size of the parent branch.

Protected Root Zone: A circular area around a protected tree with a radius equal to a tree's largest dripline radius plus 1'.

Poor Structure: These trees have grown with structural imperfections that cannot be corrected and therefore render them hazardous and more likely to fail in the future.

Remove Dead Wood: All dead wood to be removed over 3" in diameter and if over 2" in diameter when above 25', as this is a potential hazard for people under these limbs and a future health problem for the tree.

Remove Hanger: There is a broken or cut branch that is hanging in the tree and needs to be removed.

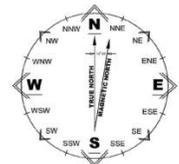

Taper: Change in diameter over the length of the trunk. These trees have grown tall but may not have the diameter strength to hold the weight of a large canopy and they are therefore more likely to fail in the future.

To Be Removed: Tree to be removed due to health and/or structural reasons. Removal should be done carefully as to not harm the surrounding trees, branches, and/or trunks above or roots below ground. Do **NOT** rip out or push over the tree stumps if they are near other trees that are to be preserved. Cut them off close to ground level and leave the stumps and roots to decay, unless they are located within a proposed foundation or area to be paved/concrete surfaced.

~: **Tilde:** This mark is used in the field in any empty box to indicate that there is no information to enter in that space.

Unbalanced Canopy: Either the trunk is leaning and/or the canopy is phototropic and overly heavy on one side.

Compass Points: These are the standard 16 points of the compass as aligned with Geographic North or True North. In our area, True North (TN) is adjusted for declination 14°49' to the west of Magnetic North (MN).

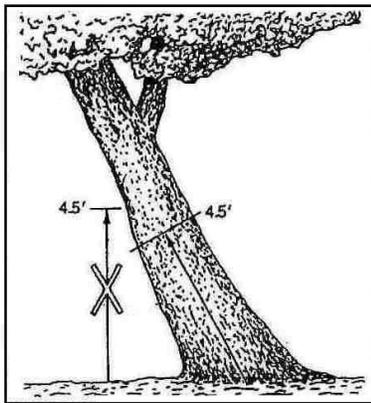

Tree Size Expressed by Trunk Diameter

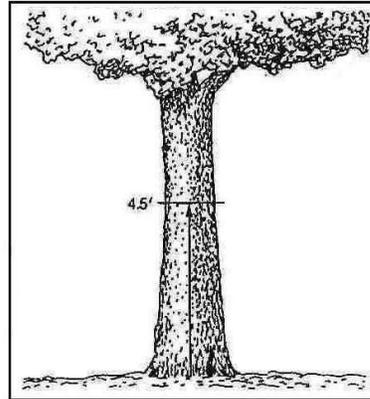

Tree SIZE Expressed by Trunk Diameter

"The height at which the trunk diameter of a tree is measured depends upon its size. The American Standard for Nursery Stock (ANSI, 1990) state that measurements shall be taken 6 inches (15 cm) above the ground for trunk diameters up to and including 4 inches (10 cm). Larger trees (assumed, but not stated, to be of transplantable size) are to be measured at 12 inches (30 cm). Trees normally considered too large to transplant are to be measured 4.5 feet [4'-6" is also called diameter breast high or dbh] (1.4 m) above the ground. Trees, like conifers, which have branches below 4.5 feet should be measured at a height that most effectively represents the size of the tree." The diameter is calculated by first measuring the circumference divided by 3.14 (π called pi) or by using a "diameter tape" whereon the inches are multiplied by π and shown to produce the diameter directly.

This is the dbh standard for measurement as shown in figure 4-2.

Figures 4-3 (top) and 4-4 (bottom). In each case, the trunk circumference should be measured at right angles to the trunk 4.5 feet (1.4 m) along the center of the trunk axis so the height is the average of the shortest and longest sides of the trunk.

Figures 4-2. Trees with fairly straight, upright trunks with the lowest branch arising on the trunk higher than 6 feet (1.8 m) above the ground should be measured at 4.5 feet (1.4 m).

There are some exceptions to the dbh standard as shown in the figures 4-3, 4-4, 4-5 & 4-6.

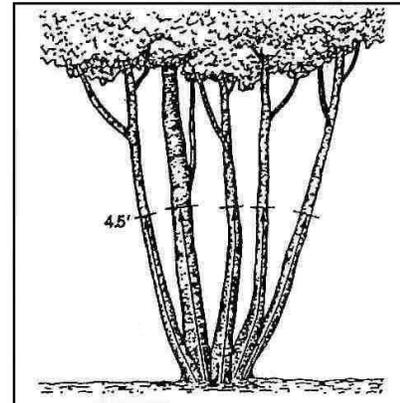

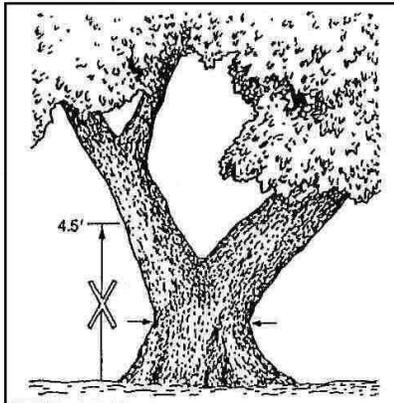

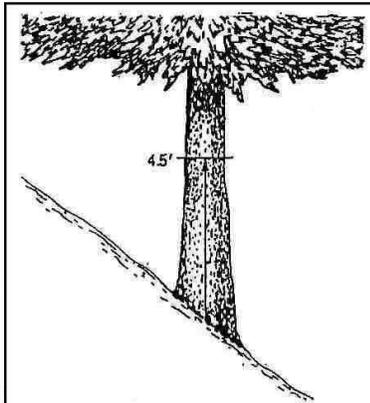

Figure 4-6. In a multi-stem tree, measure the trunk circumference of each trunk at 4.5 feet (1.4 m) above the ground. The area of each trunk is determined and then added together to obtain a trunk area that is representative of the size of the tree and each of the stems contribute its proportionate share to the canopy.

Figure 4-5. When low branches preclude measuring the trunk at 4.5 feet (1.4 m) measure the smallest circumference below the smallest branch. In this example, an alternative would be to determine the sum of the cross-sectional areas of the two stems measured about 12 inches (30 cm) above the crotch; then average the sum of the two branch areas and the smallest cross-sectional area below the branches. This may give a better estimate of tree size. Record the height of measurement(s) and the reasons the height or those heights were chosen.

Disclosure, Assumptions and Disclaimer

- 1) I, Nicole Harrison, *ISA Certified Arborist WE-6500AM*, with “**ABACUS**”, did personally inspect the site and investigated the tree(s) as mentioned in this report and I performed all aspects of this report unless noted otherwise in the report.
- 2) We have neither financial interest in the tree work that may or may not be done, nor financial interest in the property where the tree(s) is (are) located unless noted within the report.
- 3) All opinions and recommendations expressed herein this report are ours solely. We have used our specialized education, knowledge, training and experience to examine the tree(s) and to make our opinions and recommendations to enhance the beauty, health and longevity, with an attempt to reduce the risk of who and/or what is near these trees. We cannot guarantee or warranty that a tree will not be healthy or safe under all circumstances, nor for a specific period of time or that problems may not arise in the future.
- 4) Our report with its opinions and recommendations are limited to the tree(s) inspected.
- 5) We attempt to be cognizant of the whole scope of a project, but many matters are beyond the scope of our professional consulting arborist services such as: exact property boundaries, property ownership, site lines, easements, codes, covenants & restrictions (CC&Rs), disputed between neighbors, and other issues.
- 6) We rely on the information disclosed to us and assume the information to be complete, true, and accurate.
- 7) The inspection is limited to visual examination of accessible items of the tree(s), from the ground unless otherwise noted, without excavation, probing, boring, or dissection, unless noted otherwise. Only information covered in this report was examined, and reflects the condition of those inspected items at that specific time.
- 8) Clients may choose to accept or disregard these opinions and recommendations of the arborist or to seek additional advice.
- 9) This report is copyrighted. Any modification or partial use shall nullify the whole report. Do not copy without written permission. This report is for the client and the client’s assignees.
- 10) Sketches, diagrams, graphs, drawings, and photographs within this report are intended as visual aids and are not necessarily to scale, and should not be construed as engineering or architectural detail, reports or surveys.
- 11) We shall not attend or give a deposition and/or attend court by reason of this report unless fees are contracted for in advance, according to our standard fee schedule, adjusted yearly, for such services as described.
